Windsorham Camera Club.—Open, October 21–23. Last day for entries, October 2. (J. C. Hayward, Hallgrove, Bagshot, Surrey.)

Fourth Canadian International Salon of Photography Art.—Entries, before September 10; open, October 23–November 15. (Exhibition Secretary, Canadian International Salon of Photography Art, The National Gallery of Canada, Ottawa, Canada.)

Rotherham Photographic Society Forty-eighth Annual International Exhibition.—Entries, Septem-

ber 20; open, October 12–16 inclusive. (E. G. Alderman, Ruardean, Newton Street, Rotherham, Yorks.)

Sixth Irish Salon of Photography.—Entries, September 25; open, October 30–November 6. (The Hon. Secretary, 18, Morehampton Road, Dublin.)

"Irish Travel" Photographic Competition, 1937. Cash prizes.—Entries, September 30. (The General Manager (Photo Competition), Irish Tourist Association, 14, Upper O'Connell Street, Dublin, I.F.S.)

Cyclists' Touring Club (Metropolitan D.A.) Second Annual Photographic Competition.—Entries, September 30; open, October 28–30. (G. H. Craddock, 9, Lady Margaret Road, Kentish Town, N.W.5.)

Lincoln C.C. Eleventh Annual Open Exhibition.—Entries, October 1; open, October 29–November 26. (Miss E. Redfern, 8, Cecil Street, Lincoln.)

International Salon Oval Table Society, Inc.—Entries, October 23; open, November 16–30. (Oval Table Society, Inc., 10, W. 23rd Street, New York.)

1st Rhode Island National Salon of Photography.—Entries, November 1; open, November 15–30. (J. Clement Grimes, 103, Westminster Street, Providence, Rhode Island, U.S.A.)

International Photographic Exhibition in Debrecen (Hungary).—Entries, November 20; open, January. (Aszmann Ferenc, Ferenc József ut 27, Debrecen, Hungary.)

Second Indian International Salon of Photographic Art.—Entries, January 15; open, March, 1938. (N. B. Cooper, Hon. Sec., Camera Pictorialists of Bombay, 53, Nicol Road, Ballard Estate, Bombay, India.)

Leicester and Leicestershire Photographic Society's International Exhibition of Pictorial Photography.—February 21–March 12, 1938. Last day for entries, January 29, 1938. (H. Foscutt, 19, Doncaster Road, Leicester.)

Edinburgh Photographic Society, 76th Annual Open Exhibition.—Open, March 9–April 2. Entries, February 28. (John S. Rodger, 16, Royal Terrace, Edinburgh.)

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

FAIR PLAY FOR THE VERTICAL LINES.

SIR,—The comparative width or height of an object on a photograph is in inverse ratio to its distance from the camera, i.e., if a certain gate at 20 feet distance occupies 1 inch width of picture, a similar gate 40 feet away would occupy $\frac{1}{2}$ -inch width. Take the case of a parallel-sided chimney 80 feet horizontal distance from the lens and 60 feet high above lens level. The top of the chimney will be exactly 100 feet actual distance from the lens. If the base occupy 1 inch width of picture the top of the chimney should occupy a width of exactly four-fifths of an inch. The tilted camera will give this correctly, but the rising front will give "apparent" correction, which is actually distortion.

Composing a picture, the top and bottom edges should be the limits of the angle of vision, therefore when the centre of the height is above eye-level the line of sight must adopt an upward inclination. Tilting the camera to the same inclination gives the picture exactly as seen by the eye, however much we may dislike it when we see it on paper, with vertical lines converging. Setting the camera dead level, comparable with a horizontal eye-line, and then using a rising front, gives a false picture of something beyond the range of vision; the result is the unreliable extreme edge of a potentially larger negative made by a wide-angle lens. The abused miniature camera can do exactly the same with a wide-angle lens, afterwards scrapping the unwanted part of the picture.

Admittedly the rising front gives a result comparable to a perspective drawing, but both are wrong. The latter for facility is worked from a vertical picture plane, whereas this plane should be normal to the line of sight. The plane should incline forwards at right angles to the eye-line where the latter necessarily inclines upwards, and the resulting drawing would show converging verticals.

I do not suggest that drawing or photography should be faithful to such niceties—the average eye is not trained to detect vanishing verticals except when depicted on paper, and the normal Chinese or Japanese eye does not recognise perspective even in the horizontals. My argument is that the camera tilted to face the centre of the subject gives the more exact presentation.

Can the camera lie? Yes, when fitted with a rising front.
—Yours, etc., D. WEBSTER ROBERTSON.

PERFORMANCE OF CHEAP CAMERAS.

SIR,—May I be permitted to pass on to your readers a few experiences with regard to miniature camera work?

I do not agree entirely with the statement sometimes made that the excellence of results obtained from cheap miniature cameras fitted with $f/2.9$ lenses is a matter of luck.

This suggests that the lenses themselves vary in quality between poor and excellent, whereas I feel confident in stating that this difference, if it exists, is extremely small.

In my own experience I have found that in nine cases out of ten in which poor definition is obtained the lenses are not set at their proper scale markings for correct focus. This is due simply to the fact that a cut price does not allow for careful testing and final adjustments. This fault is extremely common, and I have personally detected it in no fewer than a dozen different miniature cameras, including one which sells at a price of ten guineas.

The cure is extremely simple, as one merely has to place a piece of ground glass in the place occupied by the negative while the lens is focussed very, very carefully on a well-lighted and well-defined subject at a distance. It will often be found, in carrying out this test, that when one has got a really sharp image on the ground glass, a glance at the focussing scale will reveal the fact that it does not indicate "infinity." All one has to do at this stage is to mark the spot indicated and thereafter set the pointer in front of, or behind, as the case may show, the given markings of the scale an equal amount to the difference between our new infinity mark and the makers' mark.

One can in many instances loosen a check screw and reset the actual scale to the new position, but this depends on the design. "Infinity" is the best distance to work on to make this correction, for obvious reasons.

The greatest fault to look for and to correct at once, is when the makers' setting of infinity is slightly farther away than actual infinity! I have found this on several occasions with disastrous results, as of course *nothing* is in focus at this setting.

After checking all miniature cameras, as described, that pass through my hands I have obtained excellent results regardless of the cost of camera and have not the slightest difficulty in producing sixteen first-class "whole plates" per spool.

As I write I have before me a 12×10 from a fifty-shilling 3×4 cm. camera, which is as good in definition and quality as anyone could desire.

I trust that the foregoing remarks may help some of your readers to improve their results. It is hardly fair to blame the makers every time, as if one cares to look up the prices of lenses and shutters, subtracting these from the cost of some miniature cameras complete, one wonders how the makers can produce a body of any description, let alone pay attention to fine detail.—Yours, etc., A. SPIERS-PURDON.

ENLARGER FOR SEVERAL SIZES.

SIR,—Concerning the enquiry by S. S. (Birmingham) for a dual size enlarger, it may interest him to know that we had a similar difficulty to overcome when equipping our dark-room, as we had to cater for members using P.C. size cameras and half-V.P. at the other end of the scale.

This was easily solved by a chat with Mr. Lancaster, of Messrs. J. Lancaster & Son, Ltd., of Birmingham, who modified his standard P.C. enlarger *at no extra charge*, so that we can get a 13×9 in. print from half-V.P. and "wallpaper size" from a P.C. negative.

By using the open base of the enlarger, we can obtain a print as large as 30×20 in. from half-V.P. when the paper is fixed a few inches from the floor.

In short, we found Mr. Lancaster exceedingly helpful and willing to go to a deal of trouble to supply our special requirements.

The usual disclaimer, please.—Yours, etc.,

W. ALAN NICHOLAS
(Chairman of Committee,
Oldbury Technical School P.S.)

ADAPTING A $\frac{1}{4}$ -PLATE ROLL-FILM CAMERA.

SIR,—I should like to draw attention once again to the price of quarter-plate roll films, which cost 2s. for a six-exposure roll. If this price is compared with that charged for the $4\frac{1}{4} \times 2\frac{1}{2}$ size (1s. 3d. for eight exposures) it is fairly obvious that the makers are endeavouring to make the quarter-plate camera obsolete. This is still more in evidence when one looks at second-hand lists, to see really high-class cameras being practically given away.

I have obtained one of these, and it may interest your readers to know how easily I consider they can be adapted to the $4\frac{1}{4} \times 2\frac{1}{2}$ size of film.

Seeing that $4\frac{1}{4}$ in. is common to both sizes of films, what is required are supports for the $2\frac{1}{2}$ -in. wide spools to enable them being fitted into the $3\frac{1}{4}$ -in. camera spool chamber of a quarter-plate.

Being a wood-turner by trade, I turned four hardwood spool ends, which fit into the $2\frac{1}{2}$ -in. spool, making it up to the length of one of the quarter-plate size. One of these four has to be left with a slot and keypiece for the spool winder to fit into, the other three having just wooden pins to fit into the spools, and a hole the other side, which fits the camera pins.

I have adapted two makes of quarter-plate roll-film cameras in this way; namely, an Ica Nixe and No. 3 Kodak. Of course, the $4\frac{1}{4} \times 2\frac{1}{2}$ film being $\frac{3}{8}$ -in. less in width than one of the quarter-plate size, there is a space left each side, and although now I have riveted two metal runners, one each side, for the $2\frac{1}{2}$ -in. wide film to run on, for a long time I used my camera with adapters only, always finding that the films laid flat when turned into position, also the film numbers are quite easily seen in the red window.—Yours, etc., S. G. MANLEY.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

Messrs. Agfa Photo Ltd., of 1-4, Lawrence Street, St. Giles High Street, W.C.2, have just sent a copy of a very informative 64-page illustrated booklet entitled "How to Take Photographs." This publication is a complete elementary textbook on photography, beginning with the fundamental principles in the first twenty-five pages and then continuing with a series of short and very practical articles dealing with the photography of subjects of all types, from landscapes to portraits and sporting events. Even photography by artificial light, indoors and out, is not forgotten. The last twenty pages give a full outline of the processes of development and printing, and are no less practical than the earlier part of the book. As is only natural, frequent reference is made to Agfa cameras and materials, and full details of the characteristics of both films and printing papers of that make are given in compact and convenient form. A copy of "How to Take Photographs" will be sent post free on receipt of a request addressed to Mr. Atkins, at the above address.

Messrs. Pathéscope Ltd. announce that their Motocamera Model H will in future be fitted as standard with an $f/2.5$ lens in interchangeable mount, so allowing of its replacement when required by a lens of longer focal length. This new model, which will be priced at £7, will entirely supersede the models previously offered at £5 5s. and £6 6s. Supplies of a 2-in. $f/3.5$ telephoto lens, giving a two-times linear magnification as compared with the standard lens, are already available. In micro-focussing mount this lens costs £5 5s. The Pathéscope 9.5-mm. "Imp" Projector at £4 12s. 6d. can no longer be supplied, but accessories for it will remain available until further notice. Any further details of this apparatus, together with information as to the new 9.5-mm. films released, can be had on application to Messrs. Pathéscope Ltd., North Circular Road, Cricklewood, N.W.2.

The Camera Company, of 320, Vauxhall Bridge Road, inform us that they have purchased the entire remaining stock of roll film, ciné film, chargers and printing paper from Messrs. P.F.M. Ltd. These goods are being offered at extremely low prices, the price asked for a 30-ft. length of 9.5 Ciné-Comet film being 1s. for the orthochromatic stock and 1s. 3d. for the panchromatic. Coronet and Eumig chargers are offered at 9d. and 1s. 3d. respectively. Readers who are interested are advised to watch our advertisement columns for announcements of the prices of roll film and bromide and gaslight papers.

Stolen between the hours of 6.30 p.m. and 9.15 p.m., on Saturday, the 31st

July, at Berry Hill, Sussex, a Ciné-Kodak 8, Camera No. 9532. Will any reader who may be able to assist in tracing the missing article please communicate with Mr. E. A. Thorogood, 15, Ashcombe Avenue, Surbiton, Surrey.

Mr. D. E. M. Wright informs us that he has now resigned from the secretaryship of the South London Photographic Society, and in future all correspondence should be addressed to the new Secretary, Mr. P. S. Johnston, 67, Kimble Road, Colliers Wood, S.W.19.

The Agfa Club has recently been instituted in order to keep amateurs advised of all the latest developments of photography with Agfa apparatus and materials, and to assist them in any difficulties they may encounter. Free advice on photographic problems is given when required. Would-be members can enrol by sending their name and address, together with a carton belonging to any of the Agfa films, to Mr. Atkins, Messrs. Agfa Photo Ltd., 1-4, Lawrence Street, St. Giles High Street, W.C.2.

Mr. G. A. Forman, the secretary of the St. Helens Camera Club, informs us that he has now changed his address to Wensley, Bleak Hill Road, St. Helens, Lancs.

A course of practical lessons, demonstrations and lectures on Modern Photography will be given on Tuesday evenings at the Highbury Literary Institute. Camera users residing in North London will no doubt be pleased to learn of these forthcoming classes, which commence in September, under the direction of Mr. S. Alfred Dawes. Application should be made to the Highbury Literary Institute, Highbury Grove, N.5.

We have received from the Oxford Photographic Society a copy of their Coronation Souvenir Brochure, which is a very informative and well illustrated little booklet. Apart from general information regarding the Society, which has now been in existence for over ten years, the publication contains many useful articles for the beginner and the more advanced worker, as well as a number of reproductions from the Society's Exhibition. The Hon. Secretary, Mr. Henry R. F. Sturch, Hopewell, Elms Road, Botley, Oxford, will be very pleased to send any particulars to amateur photographers in the district who are interested, and on behalf of the Society extends a very hearty welcome to new members.

Mr. George Guthrie, Capitol Theatre, Queen Street, Cardiff, is the latest winner of the Wallace Heaton Weekly Competition. This is the first of the "Sunbathing Studies," and readers of "The A.P." will find full particulars of this competition each week in our advertisement pages.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. The series from No. 1 to 61 included all standard chemical and optical formulæ and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulæ issued by the leading manufacturers of plates, films and papers.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5 x 3, supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is $5\frac{1}{2} \times 3\frac{1}{2} \times 3$ and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

88. Makers' Formulæ: Developers for Barnet Papers—(1)

M.Q. for Bromide Papers.

Metol	..	10 grs. (1.05 grm.)
Sodium sulphite (anhydrous)	..	175 grs. (18 grm.)
Hydroquinone	..	30 grs. (3.1 grm.)
Sodium carbonate (anhydrous)	..	130 grs. (13.5 grm.)
Potassium bromide	..	10 grs. (1.05 grm.)
Water	..	20 oz. (1,000 c.c.)

If crystallised sulphite and carbonate are used, take 350 grs. (36 grm.) of each.

Development should be complete in $1\frac{1}{2}$ to 2 mins., and the temperature should be maintained at from 60 to 65 degrees Fahr.

Amidol for Bromide Papers.

Amidol	..	50 grs. (5 grm.)
Sodium sulphite (anhydrous)	..	325 grs. (32.5 grm.)
Potassium bromide	..	10 grs. (1 grm.)
Water to	..	20 oz. (1,000 c.c.)

If crystallised sulphite is used, take double the above amount.

This developer should be used within 3 days of being made up. Development should take place at 60 to 65 degrees Fahr., and should be complete in $1\frac{1}{2}$ to 2 mins.

Developer for Bar-Gas Paper.

Metol	..	16 grs. (1.8 grm.)
Hydroquinone	..	60 grs. (6.8 grm.)
Sodium sulphite (anhydrous)	..	350 grs. (40 grm.)
Sodium carbonate (anhydrous)	..	220 grs. (25 grm.)
Potassium bromide	..	6 grs. (0.7 grm.)
Water to	..	20 oz. (1,000 c.c.)

If crystallised sulphite and carbonate are used, take respectively 700 grs. (80 grm.) and 600 grs. (68 grm.) in place of the amounts given.

For Vigorous Bar-Gas use the developer undiluted, and develop for 45 secs. at 60 to 65 degrees Fahr.

For Soft Bar-Gas, dilute above developer with its own bulk of water. Development should be complete within 2 mins. at 60 to 65 degrees Fahr.

For colder tones, reduce the potassium bromide to half or even one-quarter of the amount given.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a *separate* stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Amateur's Photograph Displayed.

I recently had an enlargement made from a treasured negative under a free enlargement scheme. The firm who did this were chemists. Now in at least two chemists' windows a copy of my print appears, advertising enlargements. As this may prejudice my chance of winning a competition with this photograph, I should like to stop this exhibition, or alternatively be paid for the use of my negative. W. G. M. (Devonshire.)

As the enlargements were apparently made for you for nothing the firm probably reserves the right to use such work as samples, the enlargement supplied to you serving as fee for the loan of your negative and permission to display. If you had paid for the work they would have had no right to make use of your negative in any way.

Press Agencies.

Could you tell me of a reliable agency for submitting photographs to newspapers and magazines? A. P. (London.)

The agencies mentioned below all undertake work of the type that you require.

The Associated Press of Great Britain, Ltd., 2 and 3, Hind Court, Fleet Street, E.C.4; British International Photos, Ltd., 176, Fleet Street; General Photographic Agency, Ltd., 131, Fleet Street; Keystone View Co., 12, Wine Office Court, Fleet Street; Central Press Photos, Ltd., 119, Fleet Street; Sport and General Press Agency, Ltd., 2 and 3, Gough Square, Fleet Street; "Topical" Press Agency, 10-11, Red Lion Court, Fleet Street; Wide World Photos, Salisbury Square House, Salisbury Square, E.C.4; Planet News, Ltd., 3, Johnson's Court, Fleet Street; London Press Photos, 153, Fleet Street; Photopress, Ltd., Johnson's Court, Fleet Street; M.C. Photos, 152, Fleet Street; Express Photos, Ltd., 28-29, Poppins Court, Fleet Street; London News Agency Photos, Ltd., 46, Fleet Street; G. Denes, Field House, Brems Buildings, E.C.4.

Selling Negatives.

I recently submitted some negatives of locomotives to a publishing firm, who have written to ask me what price I want for each negative. They will, I think, be used for making postcards. Can you tell me what the usual price in such circumstances would be? H. K. (Stockport.)

All such matters as that you name are questions of arrangement between the parties concerned. Either you must ask the firm to make an offer, or you must quote a price yourself, but, in either case, it depends upon what value you yourself place your negatives. Probably something like half a guinea would be a reasonable price, unless the negatives have some special value other than as straight record photographs of the subject taken.

Stereoscopic Society.

A letter in a recent issue mentions "The Stereoscopic Society." As I am interested in stereoscopic work, and have a 45 x 107 camera, I should be very glad to know the Society's address. G. M. (Yeovil.)

The secretary of the Stereoscopic Society is Mr. H. J. Mobbs, 89, Green Lane, Edgware, Middx.

Drying Prints.

Can you tell me how I can speed up the drying of prints, and how to prevent them from curling up as they dry? C. F. S. (Salisbury.)

You do not say what paper you are using for your prints, and methods of hastening drying that might be used for some papers would not be suitable for others. Most paper, however, can be safely surface-dried with special blotting-paper sold by photographic dealers. If they are then pinned up by one corner to the edge of a shelf they dry very rapidly, particularly in a warm, dry room. There is no means of preventing their curling, but you will find that prints on double-weight paper curl much less than those on ordinary single-weight paper. Unfortunately, however, they take a good deal longer to dry.

Self-Portraiture.

I should be glad if you would give me some hints on taking a self-portrait. I want to be able to see myself in a mirror at the time of exposure, and also to be sure I am not out of the picture. My shutter has no delayed-action release.

J. L. (Stanmore.)

For taking a self-portrait the lighting, focussing, etc., should be arranged just as though you were taking a portrait of somebody else. If you can obtain a model to act as a substitute for you during the arranging of the camera and lighting you will find it much easier to visualise the results that you will get. Do not put the camera too near, but leave a margin for error, in case you take a position slightly different from that of your model. A mirror placed close to the camera would enable you to observe your own expression, and a long wire release would make it possible for you to fire the shutter yourself.

Moonlight on Water.

I wish to take a photograph of a full moon making a path across the sea. Should I use my largest stop (f/6.8) or should I stop down? And what exposure should I give? I might add I have tried taking "moonlight" pictures by under-exposing in sunlight, but would like to photograph the real thing. K. L. (Eastbourne.)

You are overlooking the fact that when the only illumination is moonlight the exposure must be a long one, and, therefore, you could not photograph moving water. So far from requiring a small stop to make such an attempt, the only chance of success would be with the largest lens apertures made. With such a lens and a super-speed film something possibly might be obtained, but the chances are that the result would not be nearly as good as many of those obtained by sunlight. But if you do not mind water blurred through movement you might like to try your luck with about 1 minute's exposure at f/6.8, using a super-speed panchromatic film.

Quick Drying.

I need to do some quick drying of glass plate negatives and of prints. Can you please tell me the proper procedure? A. T. (Dewsbury.)

To dry your negatives and prints quickly your best plan will be to give them, after the final washing, two or three minutes in a 10 per cent solution of formalin. A considerable amount of heat can then be applied to expedite the drying without danger of melting the gelatine.

Photographing Sunsets.

Is it possible to get a good picture of a sunset, seeing that it means letting the sun shine straight into the lens? And will a photo-cell meter indicate correctly for such a subject? And should I use a filter? J. L. H. (Derby.)

You are likely to meet with trouble if you let the sun shine into the lens. It should be more or less obscured by the clouds. A meter will, of course, help you, but if you include more than the sky you must make allowance in the exposure for foreground objects, unless you want them merely as silhouettes. As a rule it is advisable to use panchromatic material, but there is no definite rule as to whether or not a filter will be an advantage.

Beauty and the Best

Rolleiflex

The beautiful workmanship and precision of the Rolleiflex camera, and the beauty of its simplicity of operation are the reasons why it produces such beautiful pictures. The "Daily Herald" 1935 and 1938 big prizes, totalling £5,500—were won by it, and numerous other first prizes. And here's your opportunity to snap beauty with the best. On our new extended payment plan the

ROLLEIFLEX COSTS ONLY 9d. A DAY

Here are some of its features: 12 pictures on 3½ x 2½ roll film for 1/-; enlargement expense eliminated. Simplest, most efficient focussing, with magnifier and ground-glass screen. Picture seen actual size, right way up even during exposure. Instant readiness, with "stop," speed and focussing all in view. Zeiss Tessar 1/8.5 lens, Compur Rapid shutter from 1 to 1/500th sec., T. and B. D.V. finder for speed subjects. Option of plates or cine film. Price £25

The most generous exchange allowances in the trade.

MIDDLEMASS & CO., LTD., Penryn, Cornwall.

"THE A.P."

Special Competition for Novices

THIS competition is specially for Novices, that is to say, those amateur photographers who have never won an award of any description in a photographic competition, and preferably those who are only just starting photography.

The prizes will be awarded for the best snapshots of subjects that the beginner usually attempts. These include snapshots of the family, groups or single figures taken at home or on holiday, either indoors or outdoors, and landscape and beach scenes, etc., with figures. The arrangement of the subject and the pose of the figure or groups is a matter left entirely to the discretion of the competitor.

The entries will be restricted to contact prints. These may be mounted if preferred, and the smallness of any print will not affect its careful consideration in this competition. The rules are very simple, but should be read carefully.

THE PRIZES.

The prizes in this competition will consist of supplies of roll film or plates (for those winners who happen to use a plate camera), as follows:—

The First Prize will be TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.

The Second Prize will be TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.

The Third Prize will be ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.

Twelve Prizes of ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

RULES.

Each print must have affixed firmly to the back a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor. The latest date for receiving entries is September 30th.

The copyright of all prints entered remains the property of the authors of the photographs, but the right is reserved by "The A.P." to reproduce the winning prints and any others that may be worthy of mention. The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed to: The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices' Competition."

A GOOD CAMERA IS AN INVESTMENT... you can "Bank" on us

Glance at the four selected examples showing the small weekly amounts required on our "Out-of-Income Terms," and realise that the camera you have longed for is as good as yours.

5/6½ a week—22/2 a month—buys Exakta Model B Multispeed, with Tessar f/2.8. Cash price £27 10 0

8/8½ a week—34/10 a month—buys Contax II, Tessar f/2.8. Cash price £43 5 0

4/7 a week—18/4 a month—buys Super Ikonta II, Tessar f/3.5. Cash price £22 15 0

3/3 a week—12/11 a month—buys Wirgin Edinex 24×36 mm., Xenon f/2, Compur Rapid. Cash price £15 0 0

Any apparatus over £10 supplied on 24 monthly payments at cash price plus 7½ per cent; under £10 5 per cent is added, and 9 to 15 monthly payments according to value.

Our Part-Exchange Allowance on your present camera provides the first payment and will probably lessen the subsequent ones. Every transaction receives personal attention, and formalities are reduced to the barest minimum.

APOLOGY

For the second year in succession we find it necessary to apologise for delay in delivery of the "REFLEX-KORELLE."

The demand has far exceeded the supply in spite of every effort on the Manufacturers' part to keep up with it.

We have now received information that further supplies of nearly all models are on the way. The f/2.8 Zeiss Lens will not be available until December, however.

Will those Dealers and Dealers' Customers who have waited more or less patiently for so long kindly accept our thanks and this assurance that the finest of all Reflex Cameras will shortly be in their hands.

PHOTO-OPTICS LTD
32, Lord Street, LIVERPOOL 2.

IMMORTAL MEMORIES

Have you ever reflected that the advent of cinematography has given immortality to those whose memory is enshrined in the celluloid reels of the amateur's private library? His children shall not grow old, nor shall his loved ones die! The human memory is a faithless thing—but the cine camera captures the truth, and perpetuates loveliness, happiness and joy through all one's years! WHY NOT LET US SHOW YOU HOW TO CAPTURE THE ONES YOU LOVE BEST?

We give below a selection of the second-hand equipment we can offer from stock—and should be delighted to supply any of it on hire purchase. Of course, we should be only too pleased to take your present outfit in part exchange.

BELL & HOWELL

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS:—

12 words or less 2/6
2d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 230, Deansgate, Manchester, 3; 26a, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

THE fun of the family party, the joy, the goodwill, the action, will be lost unless a living record is produced.

Make permanent the daily doings of your holiday with a Ciné Camera.

WE OFFER—

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer," when both parties are advised of its receipt. The time allowed for decision is three days, after receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged; over £10 and under £50, 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to **LILFE & SONS LTD.**, and crossed. Notes being untraceable if lost in transit should not be sent as remittances.

& Co.

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

CAMERAS AND LENSES

RANGE-FINDER VAUXHALL MINICAM

TAKES 12 OR 16 PICTURES
ON STANDARD 3½×2½ FILM

FINEST MOROCCO
LEATHER COVERING

THE CAMERA COMPANY are proud to announce this exclusive new Vauxhall Super-Minicam with Coupled Range-finder.

Here is a coupled range-finder miniature, fitted with the finest quality f/2.9 anastigmat lens in delayed-action Compur shutter, selling at a price which YOU can afford. Actually its nearest competitor is approximately 40 per cent higher priced—BUT the Vauxhall has numerous advantages not to be found in other cameras of this type.

For instance, it takes two sizes of picture according to choice—either twelve 2½ in. square or 16 2½×1½ in. Another exclusive feature is the special radial focussing lever which automatically springs back into the infinity position when the camera is closed, thus preventing any possible damage to the camera or focussing mechanism.

PRICE £11 15s. ONLY

Yours for 20/7 down and eleven similar monthly payments.

★ SEND FOR LEAFLET ★

STANDARD MINICAM

(without Coupled Range-finder)

This popular model is of similar construction and specification as the above Super-Minicam, with the exception that it has a direct-vision optical view-finder at the side in place of the coupled range-finder. Also micrometer lens focussing is fitted instead of the radial focussing lever.

PRICES:

2½ square or V.P., f/2.9 anastigmat, Compur shutter **£6 : 19 : 6**
(Or under our SELF-FINANCED Hire Purchase Terms of 12 monthly payments of 12/3.)

Ditto, with Prontor II shutter **£5 : 19 : 6**
(Or under our SELF-FINANCED Hire Purchase Terms of 12 monthly payments of 10/6.)

BALDAX

Roll-film camera for 16 pictures 1 1/2 x 2 1/4 in. on standard 8-exposure 2 1/4 x 3 1/4 in. roll film.

Here is a pocketable

camera. The precision

mechanism and compact

design combine to

produce perfect pictures.

Rapid in use; you

just press a button

and the camera front

springs into position.

All-metal body, leather

covered, nickel fittings

and direct-vision

view-finder. Direct

spring view-finder of

two optical units

enables quick finding

of the picture. Pressure

plate holds film in exact

focal plane during the

exposure. Struts of

entirely new design

assure a rigid grip upon

"THE YACHTING WORLD"

AND MOTOR BOATING JOURNAL

EVERY FRIDAY 6d.

A New Book which will help you to get the best results with your camera

Brighter Photography

by DAVID CHARLES,
F.R.P.S.

This handy book reveals in a clear, attractive way the secrets of successful photography. Though primarily intended for the novice, it is invaluable to every keen camera user.

The carefully arranged chapters cover the whole field from the choosing of a camera to developing and printing the finished picture. Details of the various photographic materials on the market are given, and there are important sections dealing with Focussing, Aiming the Camera, Photographic Groups, Lighting and Exposing.

In addition there are over one hundred and sixty illustrations, each numbered and each conveying a really useful hint. By simple cross references these illustrations provide a series of clear, concise lessons in the art of making better pictures.

Paper Boards Size $7\frac{1}{2} \times 5$ in.

WALL'S DICTIONARY of PHOTOGRAPHY

and Reference Book for the Amateur and Professional Photographer

Fourteenth Edition—Revised

Edited and largely re-written by
F. J. MORTIMER, Hon. F.R.P.S.

A complete reference work for the practical photographic worker. It provides useful information in dictionary form on every phase of photography—technical, pictorial, scientific and general, and is in itself an explanatory index to all terms, formulae, etc. All the latest photographic principles are incorporated in the present edition, which includes up-to-date information on all recent developments.

ZODEL LENS HOOD**

It enables you to get beautiful pictures even facing the sun or glitter of the silvery sea. You can't get these effects without a lens hood. Easily fixed. Telescopic and folds flat for carrying. State diameter of lens when ordering. Only **7/6**

WARNING

"AUTOMAX" (Regd.) PRINTS

It has been brought to the notice of Master Photo Finishers Ltd. (Wallace Heaton, Managing Director), that a number of firms have been supplying prints of their own under the description of "Automax." Please note that these prints are the particular product of Master Photo Finishers Ltd., and that "Automax" is their registered trade mark. Anyone detected in supplying under the description "Automax" prints which are not made by this Company will be proceeded against.

"Automax" prints can be ordered from Wallace Heaton Ltd., of 127, New Bond Street, London, W.1. and from their branches, also from the branches of City Sale & Exchange (1929) Ltd., and from other dealers who are authorized by Master Photo Finishers Ltd. to retail "Automax" prints. No print is a genuine "Automax" unless it bears the trade mark "Automax" printed on the back.

"Microlux" (Regd.) is also a registered trade mark belonging to Master Photo Finishers.

Here's wishing you (and showing you) all the best for your holiday. If you haven't yet been away we hope it will be fine for you. It **CERTAINLY** will if you come or send to Bond Street first. We have all the ingredients for the best holiday you've ever had. Whether you choose the highest or the lowest priced mini or ciné camera, or if you are still a "roll filmer," there are so many little gadgets and services at Wallace Heaton's that a visit to us before your holiday is nearly as enjoyable as the holiday itself. The items on this page are "not the only pebbles on the beach." Write and tell us your requirements—we shall be happy to help you. Why not send us your present camera in the post? State which make of new camera you're interested in. We will then tell you how much we will allow you on it and give you particulars of our E-X-T-E-N-D-E-D payments.

MAKE IT SOMETHING "LEICA" HOLIDAY

We have every Leica model in stock. Shown here is the **Model IIIa**. Chromium model, speeded to 1/1,000th sec., f/2 Summar lens in collapsible mount, 36 exposures at a loading.

24 monthly payments of 38/7.

HAVE A HOLIDAY WITH MINNIE MINNIE WHO? MINICAMERA

Why not a Zeiss Contax? The famous precision instrument speeded to 1/1,250th sec. With f/3.5 Zeiss Tessar lens **£40 10 0**

24 monthly payments of 36/4.

ENTER FOR WALLACE HEATON'S HOLIDAY COMPETITION

It's interesting and topical. You may win £25 cash. See details on page 1 of this issue.

Oh, I **do** like a "Leica" by the seaside!
Oh, I **do** like a "Leica" by the sea!
It's **fun** making pictures on the prom-prom-prom!
While the brass band goes tiddley-om-pom-pom!
Yes, I **do** like a "Leica" by the seaside!
Yes, I **shall** take a "Leica" to the sea!
And as Wallace can't be beaten
I shall **post my films** to Heaton
From the seaside—yes, from the sea!

YOUR HOLIDAY GUIDE

Send 2d. postage for free list of still cameras, ciné cameras, accessories, or anything in which you are interested. It will make it easy to choose the best apparatus for your holiday.

"AUTOMAX" (Regd.) PRINTS

These enable you to get really appreciable size prints from your miniature negatives at the barest margin of extra cost. For example:

"Automax" (2 1/4 x 3 1/4) from Leica and similar size negatives cost only 2/ a dozen.

"Automax Super" (3 1/4 x 4 1/4) for 2/6 a dozen.

"Automax Square" (3 1/4 x 3 1/4) from Rolleiflex, Ikonflex, and similar size negatives, 2/6 a dozen.

STRIP PRINTS FROM LEICA and OTHER 36-exposure 35-mm. FILMS

Here's a chance to get contact prints at less than a penny each. We are doing a full 36-exposure strip of prints on paper at 2/6, or on transparent film, so that you can project them as "stills," on the cine screen, for 5/- per 36 exposures. A photo-electric installation ensures uniformity of results, even from widely-differing negatives. Give this service a trial—you can always depend on quality work at Bond St. We have the finest D. & P. works in the country.

Negative on Selo Hypersensitive Panchromatic Roll Film—Alpha Filter.

CAPTURE THE GREATER BEAUTY OF TRUE-TO-COLOUR TONES

The photographer who wishes to improve his work will gain much by changing over to SELO Hypersensitive Panchromatic Roll Film.

Fast enough to ensure sparkling negatives from ultra rapid exposures, even when light is poor, SELO Hypersensitive Panchromatic Roll Film responds to the entire colour range and yields pictures remarkable for the beauty and delicacy of their tonal gradation.

SEND IN YOUR JOLLY SNAPS FOR OUR "HAPPY HOLIDAYS" PHOTOGRAPHIC COMPETITION

Here's a chance to win a good cash prize while enjoying your holiday. Think what happy snaps you can make! Donkey rides, sails round the bay, castles in the sand—snap the true holiday spirit—there's scope whichever way you turn—and there's MONEY for the best pictures. It's a competition which every amateur can enter into whole-heartedly. Don't miss the chance—remember GOOD PHOTOGRAPHY is what the judges are after.

RULES AND CONDITIONS

All entries to be judged by Wallace Heaton Ltd., whose decision shall be final. AMATEURS only (full name, address, title of entry and coupon on back of each entry). ANY MAKE OF CAMERA OR MATERIALS. DEVELOPED, PRINTED OR ENLARGED ANYWHERE. ANY SIZE, MOUNTED OR UNMOUNTED (not less than 8×6 unmounted is recommended). SPOTTING ONLY TO REMOVE DEFECTS (no faking or retouching). WALLACE HEATON LTD. HAVE THE RIGHT TO PURCHASE THE NEGATIVE AND COPY-RIGHT OF ANY PHOTOGRAPH SUBMITTED FOR TWO GUINEAS (If a guinea prize-winner, for an extra guinea), OR RIGHT TO ONE REPRODUCTION, 10s. 6d. Copyright of the £25 prize-winning photograph and negative becomes the property of Wallace Heaton Ltd. without further payment. Prizes are 21/- each week and 6 Certificates of Merit. £25 (twenty-five pounds) for the best photograph submitted during the competition (13 weeks). If stamped addressed envelope is enclosed every endeavour will be made to return photographs to competitors. No guarantee of safe return can be made, and no entries will be returned unless above is complied with. Acceptance of these rules, etc., is a condition of entry. A selection of the best entries will be held back at the close of the competition for exhibition in our galleries prior to their return. Our gallery is **always** interesting, call and see it when in Town—free, of course.

SUNBATHING COMPETITION. Last week's winner was—

Bedford.

I feel I must write and thank you for the way you have treated me with regard to the sale of the camera. I am deeply grateful to you for the concern you showed to ensure I had what I wanted, also for the generous terms you allowed me, and I hope to take further advantage of your kind offer at a later date. I will certainly recommend my friends to you."

● The WESTMINSTER invite you to participate in yet another GREAT OPPORTUNITY by offering you a strictly limited number only of

ZEISS IKON

Model 530/15

SUPER IKONTAS

Brand New, exactly as originally issued by makers.

The magnificent specification includes ZEISS IKON BUILT-IN REVOLVING WEDGE-RANGE-FINDER, famous Zeiss f/4.5 Triotar anastigmat, Klio shutter, 1/5th to 1/100th sec. and delayed action, optical direct-vision finder, rapid self-erecting front, etc., etc.

● Most attractive Picture Sizes ●

For 8 exposures 4 1/2 x 2 1/2 in. on normal spool, with option of 16 2 1/2 x 2 1/2 by removable mask. Full size is most pleasing shape and generous dimensions; smaller is amply big enough to give good picture of itself, yet exceedingly economical.

WESTMINSTER

Bargain Price

£9 : 17 : 6

12 monthly payments of 17/4.

● In view of this Out-of-Income privilege (quite exceptional with a Special Offer such as this) earliest possible application is strongly urged.

'You'll find you always do much better at the WESTMINSTER' . . .

The service resources and facilities of the Westminsters have always been of a standard particularly their own. Now, more than ever, the outstanding advantages of the Westminster OUT-OF-INCOME Plan—with its exceptional privacy and simplicity, above all, its unique CUSTOMER PROTECTION features—inspire the appreciative comment: 'you always do much better at the WESTMINSTER.'

Takes 8 pictures
3 1/2 x 2 1/2 or 16
2 1/2 x 1 1/2 on standard
3 1/2 x 2 1/2 film

Voigtlander

'BESSA'

Built-in Range-finder.

Unique trigger release under baseboard. Yellow filter permanently attached in folding mount. Quick self-erecting front, depth-of-focus scale.

No room for doubt!

You'll never have any doubts about your photographs being successful if you use the "AVO" Exposure Meter. It gives direct indication of correct exposure with unique clearness. Tells you at a glance the correct aperture and shutter speed to use for the light prevailing at the actual moment of taking the photograph. Simple, accurate, easy to read, it leaves no room for doubt about correct exposures.

A USER WRITES: "I have found the 'AVO' Exposure Meter to be the best investment I have made since buying my camera."

5 IMPORTANT POINTS:

- Method of indicating exposure is unique.
- Indicates exposures from 60 secs. to 1/2,000 of a sec.
- Not affected by extraneous light.
- Size 2½×2½×1 in. Held and operated in one hand.
- For Still or Ciné cameras.

BRITISH MADE.

PURMA SPECIAL

THE BEGINNER'S MINIATURE

Ordinarily, to take successful action and high-speed subjects needs some photographic experience and skill. But anyone can get successful action pictures (or any other kind) with a PURMA SPECIAL. Its very special design eliminates focussing, lens and shutter speed setting, and does away with all kinds of calculations. All you have to do is hold up the camera and shoot. The adjustment of the three speeds, 1/25th, 1/150th and 1/450th, is **automatic**—decided by one of three ways of holding the camera. From each roll of ordinary V.P. film costing 1/- you will get 16 clear, sparkling pictures—action—landscape—indoors—and (with a simple attachment) portraits. Fitted f/6.3 Beck lens. With the PURMA SPECIAL you can indulge in the most enjoyable miniature photography at the least expense. For the PURMA SPECIAL camera costs

Actual size of contact print.
Taken 11.30 a.m., winter sunlight,
panchromatic film, medium speed.

ONLY 50/-

Interchangeable Telephoto Lens.
Schneider Tele-Xenar f/5.5—
5 cm..... £10 0 0

- Shoots sequence pictures with machine-gun speed.
- Lens always in "ready" position—no withdrawing necessary.
- Film winds itself automatically.
- Shutter sets itself automatically.
- Film counter operates automatically.
- No double or overlapping exposures possible.
- Automatic "Zone" focusing gives needle-sharp definition and supercedes range finders.
- Takes up to 60 exposures on Standard 35-mm. film.
- Dual cassette loading permits removal of any part of film at any time for development.
- Camera opens in daylight for changing from "pan." to colour film at any moment.
- With motor wound takes from one up to 24 exposures in quick succession, or singly.
- Motor can be left permanently wound.
- Incorporates filter suitable for "pan" or "ortho" films.
- Exposure automatically compensated when using filter.
- Shutter gives "Time" and from 1 sec. to 1/500th sec.—and all intermediate speeds.
- Weighs 14 oz.—just heavy enough to be held comfortably without risk of movement.
- Overall size only 4½ x 2½ x 2 in.
- Three view-finders in one, including "right-angle" for "candid" work.
- Daylight loading spools available.
- Camera has stainless steel body, covered black morocco.

Take all the swift advantage of the hours

—“TWELFTH NIGHT.”

Make sure the imprint of the fleeting days
Take swift advantage of the passing chance,
The sunlit aisle, the shadowed porch,
The carefree smile, the pensive mood,
Tall peak, vast plain, and vaster sea,
Unbounded cloudland and the gnarled tree.
Let no inspired opportunity escape
Your shutter's well-timed dalliance
Nor fail to make those records positive
Upon the rich warm black of Mezzotone.
Mark how advantages do crowd upon
Your work: The easy toning by development,
The speed that doth approximate unto
A bromide paper's boon rapidity.
Assuredly wide latitude will right
Exposure's faults (if such could ever be!).
Full tonal range of perfect negatives
Is faithfully reflected in the print
Upon a surface Silky Rough or Smooth
Or Grained, or Opal, Lustre—what you will.
And now advantages are added to
By listing Mezzotone at Bromide price.

PHONES: L. MUSEUM 6022-3-4

When exposed you will find the film has wound itself into the opposite cassette, which just lifts out and is ready for developing. Enlargements from these negatives $3\frac{1}{2} \times 2\frac{1}{2}$ 2/- per dozen. Strip prints $3\frac{1}{8}$ for 36, or film positives 5/- for 36. Developing 12-exposure cassettes 9d.

Agfa 12-exposure cassettes are supplied in Isochrom F film at 1/5, or Isopan F film at 1/7. Just drop the cassette in the camera, pull out sufficient film to engage the sprocket, clip down, shut the camera and you're ready.

HOW LONG DOES IT TAKE TO LOAD YOUR PRESENT CAMERA?

THIS REMARKABLE NEW

Agfa Karat

IS EASILY LOADED WITHIN 10 SECONDS

The Agfa Karat has completely overcome the bugbear of laborious and irritating loading. Imagine the occasions when you have had to miss really good pictures because your camera was empty and there was insufficient time for reloading. 10 seconds is not long, and in that time you are completely set up ready for 12 rapid shots with the new Agfa Karat. This virtue does not by any means stand alone—it has a good f/6.3 lens, snaps out into the ready position at a touch of a button. A shutter speeded to 1/100th sec. Takes 12 exposures on 35-mm. film. An automatic lock prevents double or blank exposures. Automatic picture counter. As the "Miniature Camera Magazine" says, "The Karat is really a remarkable little instrument."

A NEW PROJECTOR FOR MINIATURE COLOUR FILMS

"DIAFANT" MODEL O

This new projector for 24 x 36 mm. positives from miniature negatives is an efficient, light and easily portable apparatus for use at home, at the houses of friends or at club meetings and social gatherings.

Equipped with a 100-watt lamp at 12 feet from the screen it throws a brilliantly-illuminated image, measuring 4 ft. 6 in. by 3 ft. It is precision built, beautifully finished and fitted with a lens of fine quality.

£8:15:0
Lamp extra.

"DIAFANT" MODEL I

Suitable where screen pictures up to 9 ft. wide are required, also for projecting miniature colour films. This instrument is similar to the Diafant Model O in general design, but takes a 250-watt lamp; in view of the larger light intensity the lamphouse is more roomy and a heat-absorbing filter is used in conjunction with the condensing lens.

The slide carrier takes slides 2 in. square with a picture mask of 24 x 36 mm.

£12:15:0
Lamp extra.

SANDS HUNTER & CO., LTD., 37, BEDFORD STREET, STRAND, LONDON, W.C.2

A PLEASURE TO USE — AN ECONOMY TO OWN

There are 5 Brilliant models, from the latest Brilliant V6 with f/3.5 Voigtlander Voigtar lens and Compur-Rapid shutter at £9 to the model illustrated which costs, with f/7.7 Voigtar lens,

45/-

It is difficult to imagine a camera more sensibly designed for ease of manipulation and for the certainty of securing excellent results.

Its large (almost full-size) view-finder is so wonderfully luminous that you can see clearly just what the picture view will be.

Besides, you get 12 pictures 2 1/2 in. square on standard 3 1/2 x 2 1/2 films—12 for the price of 8!

Ask at your dealer's for a demonstration, or write to-day for the interesting Brilliant brochure.

VOL. LXXXIV. No. 2546.

FIVE weeks hence, on the last day of September, our Special Competition for Novices will close. While no subjects are barred, the intention of the competition is to encourage the beginner by offering generous prizes as an extra incentive to produce really good pictures of the kind of subject a beginner usually takes. The holiday harvest of negatives is likely to deal with just such subjects, and we hope and expect that the pile of entries, already large, will be considerably augmented by prints made during the next five weeks from negatives taken during the holiday period. We would like to announce here, in response to many requests, that we will accept as entries enlargements of the standard "Enprint" size, as made by all photo-finishing firms. These small enlargements from miniature negatives are now being made so universally that they rank, for all everyday purposes, as contact prints, and there must be many users of small cameras who have never even seen a contact print from their negatives. But we would add that this concession is for the convenience of competitors, who will no longer need to have a specially small print made for the competition; it will not be allowed to prejudice in any way the chances of small contact prints already entered. Revised rules of the competition, and details of the prizes offered, appear on an advertisement page in this issue.

Regalia in Colour.

A visit to the Science Museum at South Kensington is specially worth making just now, not only for the television demonstrations which still draw eager queues, but because of the two large panels, one on each

TOPICS of the Week

IN A SUSSEX LANE.

Windmills, still to be found in some parts of the country, may often provide material for a picture.

(See also article "Pictures on Highways and Byways" in this issue.)

side of the entrance, displaying "life size" colour photographs of the Crown Jewels. This work of Colour Photographs Ltd. is admirably done. It brings out the character of the regalia, which is not so much sparkle as sombreness and glowing depth. When one considers the conditions under which the work must have been carried out, and that it is not possible to treat the crowns and sceptres, the swords and spurs of England as one would treat a vase of flowers or a table of plate, it is a wonderful achievement. Most of the reproductions of regalia, alike in magazines and encyclopædias, fall back upon black-and-white representation, but while there are subjects for which black-and-white is preferable to colour, the rendering of jewels is not one of them. It is in colour that these things come to life.

A Joy for Ever.

A recent visit to Belfast, which has been entertaining their Majesties, was regarded in advance with no particular enthusiasm, for Belfast, great city as it is, has no special claims to beauty. But we reckoned without certain things. The boats from England arrive in the harbour in the early morning, and any who undertake the journey should be sure to have their cameras with them when they go out on deck. There are pictures that compose themselves. One of the most beautiful spectacles, almost ethereal in the early morning light, is the line of derricks in the ship-building yards. Graceful, feather-like structures they look, scarcely belonging to the earth. Then, if one is on the Heysham boat which is just in, one may see the Liverpool boat gradually taking shape through the mist. "Splendid

the ships they build, more splendid far the hearts that dare conceive such vastness and such power." In Belfast itself two outstanding things strike the eye. One is the City Hall, which was specially floodlit for the King's visit. The other is the Parliament Building at Stormont, especially the view of it from the beginning of the processional approach.

Children's Preferences.

An interesting social experiment has been made in Chicago among the children attending the elementary schools. The children have been carefully examined as to their pictorial preferences, and the result of the investigation has been to show

that what children like and dislike is not entirely in accord with traditional adult ideas on the subject. There are also pronounced sex differences. The boys were found to favour the action type of picture represented by sea subjects, animals, and historical incidents, while girls liked the non-action type, represented by religious, pet and childhood pictures. The picture among some dozens of well-known works which received the largest number of preferences among boys was a sea picture, "The Fog Warning," by Winslow Homer, and the picture most favoured by the girls was "Madonna of the Chair," by Raphael. Gainsborough's "Blue Boy," which was not very high up

on the list, received an equal number of preferences from boys and girls.

The Funny Little Chap.

A good-natured photographer in an African village, where photography had not been seen before, and where even the looking-glass was unknown, made friends with the native population by taking pictures of them. They were mightily interested, especially one man, the chief of the place, who came to the photographer and told him that he recognised his uncle and his brother and this person and that, but "There is one thing I want to know," he said, "who is the funny little chap in the middle?" It was, of course, the questioner himself.

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with under this heading week by week. Other replies appear as usual on the last page.

Single-Coated Films.

For some years now I have noticed that advertisements of films make a great point of their having two or more layers of emulsion, one on top of the other, and I have accepted this as being an advantage in conferring extra latitude. Now, however, I see that single-coated films, having but one layer of emulsion, are put forward as the best. What is the reason for this reversal of policy?

W. M. H. (Oxford.)

The change in policy, such as it is, is due to the fact that certain disadvantages of the multi-coated film have become more important since the advent of the miniature camera. Very small negatives that have to be enlarged many diameters must be much sharper than would ever be necessary with larger negatives, and it is for the sake of the greatest possible sharpness of definition that single-coated films are coming to the fore again—but, of course, for miniature workers only.

The multi-coated film consists broadly of a comparatively slow emulsion capable of giving considerable density, and able to record satisfactorily a very wide range of contrast. It will therefore stand quite considerable exposure without the lights becoming dense and lacking in detail, so that it imparts to the film as a whole the property of latitude in the direction of over-exposure.

On the top of this is laid a thin emulsion of high speed, which has the property of responding to illumination far too faint to produce any developable change in the slower emulsion beneath it. This top layer therefore enables detail to be obtained in the shadows of the picture. On full exposure an emulsion of this kind will give dense, detail-less high-lights, which would obscure the gradation present in the lower layer but for the fact that the thickness of fast emulsion is so small that it simply does not contain silver enough to do any harm in that direction.

Taken alone, the slow emulsion would produce excellent and "snappy" pictures provided the exposure given were long enough; with normal exposure detail in the shadows would be lacking. The fast emulsion by itself would produce a flat, thin negative with full detail in the shadows and very poor gradation in the lights. The two together produce perfect negatives from any exposure that is neither too short for the fast emulsion nor too long for the slow—which means in practice that the finished film offers a very long scale of gradation and a wide latitude in exposure.

So far, the multi-coated film offers nothing but advantages.

To get the latitude, however, the total thickness of emulsion must be comparatively great, and in making its way through towards the celluloid support the light is scattered by the particles of silver bromide of which the emulsion is made up. The image thrown by the lens is therefore a fraction blurred by the time it reaches the depths of the emulsion.

When making negatives of ordinary size this blurring is completely imperceptible, except perhaps when enlarging to an enormous size. Even then, these large prints are viewed from a distance great enough to obscure completely the slight lack of sharpness. But if the negative is tiny, an equal degree of enlargement still produces only a comparatively small print—say 12×10 —which is viewed in the ordinary way from a moderate distance. In these circumstances the blurring due to light-scatter, though still not very important, does just become noticeable if looked for.

Those photographers to whom the utmost possible sharpness is a vital matter are therefore beginning, especially in Germany, to return to a single-coated film in which the layer of emulsion is thin. By so doing, sharpness is gained, but at the cost of making it necessary to expose with much more accuracy than would be needed if the far greater latitude of the multi-coated film were available. Subjects of long tonal range, in which the lights are very many times brighter than the shadows, are particularly difficult to photograph with a film of this type, as it may happen that an exposure only just great enough to render shadow detail satisfactorily is already up to the absolute maximum that can be permitted in the lights. In such a case, of course, there is no latitude at all in exposure, and it will readily be perceived that if the subject had a still greater tonal range it could not be photographed at all without losing either gradation in the lights or detail in the shadows.

While subjects of such great range are uncommon, and in all ordinary cases the single-coated film does allow some latitude in exposure, it will be realised that it requires considerably greater care in handling than the usual multi-coated film. In addition, the latter is usually faster.

For the user of larger cameras—taking negatives of perhaps 4.5×6 cm. or over—the single-coated film does not offer any appreciable advantage to offset its shortcomings. The user of the very small camera must make his own decision as to whether he thinks the improvement in definition is likely to be worth, to him individually, the loss of the undoubted advantages that the multi-coated film has to offer.

Hints on Colour Photography

Although recent improvements in films have brought colour photography within the reach of any ordinary amateur with a snapshot camera, it differs in a few small ways from monochrome work. This article, which draws attention to these differences, will help the reader to make the very most of his holiday snapshots in colour.

FROM the point of view of the man behind the camera, the main difference between a colour film and one intended for ordinary black-and-white work is that the former permits but little latitude in exposure. Unlike ordinary film, which will always give an excellent negative provided it is neither under-exposed nor grossly over-exposed, colour film demands a closely correct exposure if it is to give the best results of which it is capable.

This means more than appears at first sight, because the lack of latitude influences the choice of subject as well as the exposure given; the problem cannot be completely solved by careful use of an accurate exposure meter, but must take subject into consideration too.

An Extreme Example.

Consideration of an extreme case will show why. Imagine we are in a church, looking out through the open doorway into the sunlit churchyard. Inside, even though the wall of the church is of white stone, and the dark wooden door is perhaps sunlit, an exposure meter may demand that one second's exposure be given to record the necessary detail. For the view outside, perhaps 1/100th sec. would be enough.

With ordinary film, an exposure of 1 second, followed by careful development, would give a negative showing good detail in both the interior of the church and the brilliantly-lit churchyard. Even though the latter is over-exposed a hundred times, the detail can still be brought out on the print.

Impossible in Colour.

With colour film, with its small latitude, an over-exposure of a hundred times would be utterly fatal to good colour-rendering, and would probably result in clear celluloid to represent the brilliant lights. The subject, therefore, cannot be taken in colour at all—unless by making two exposures and combining them.

In a lesser degree, any subject showing considerable difference in brightness between its darkest and lightest portions is unsuitable for reproduction in colour. Or if not unsuitable, at least more difficult to take than one where the lighting is

more even, so that the exposure needed to register detail in the shadows is not too much for the brightly-lighted parts of the subject.

An Unimportant Limitation.

This limitation to subjects in which the lighting is not too contrasty would be a serious handicap in black-and-white photography, in which the film records nothing more than differences in brightness between different parts of the subject. If two adjacent objects, such for example as a red flower and a green leaf, had the same brightness, an ordinary photograph would render them as indistinguishable.

Not so a colour film. By virtue of the difference in colour, the red flower would stand out as distinctly from the surrounding leaves in the photograph as it does to the eye, and the result would be a complete success in spite of the flatness of the lighting.

It used to be said that it was impossible to take satisfactory colour pictures on dull days, and while this was to some extent true with the colour material then available, it is no longer the case to-day. The best results are obtained under conditions that are best described as "diffused lighting." The best results will be obtained when the sunshine is screened by light clouds, there being sufficient power in the lighting to cast a faint but distinct shadow. In the case of close-up subjects the best results will be obtained upon dull days. Brilliant sunshine has the effect of producing contrasts too strong for colour work unless shadows can be avoided.

Soft Lighting is Best.

This preference for soft lighting applies to almost all subjects, and especially to out-of-door figure subjects and portraits. A strong lighting has the effect of losing the softer and more delicate colours such as flesh tones, and the colour of costumes. The lighter shades of colour, especially pinks, yellows, and the softer blues, are better reproduced by soft lightings than by brilliant illumination. Strong lighting is better for heavy colours such as deep reds, purples and blues.

Under dull lighting conditions it is better to give a little more exposure than the meter indicates, in order that under-exposure may be avoided.

Lighting and the Result.

Colour photography has often been accused of giving results that, while attractive to the eye, are not true to the colours of the subject. It is very difficult to decide upon this point unless the picture can be compared with the original subject under exactly the same lighting conditions that obtained when the exposure was made. This is rarely possible in the case of daylight, there being so many factors that cause differences in the appearance of the subject. In making a comparison the photographer has to consider both the lighting conditions under which the picture was taken and those under which the transparency is viewed. For example, in the case of subjects photographed towards sunset, the lighting may have a pronounced coloration.

View by Daylight.

As has already been hinted, the light by which the transparency is seen has to be taken into consideration too. This matter has been discussed ever since colour photography first became a practical proposition. Sometimes early transparencies which were brilliant by daylight became almost devoid of colour by incandescent gaslight. While the modern colour film has been considerably improved in this respect, it is safe to say that if the subject was photographed by daylight the transparency is seen at its best either by daylight or by artificial lighting so screened that it is equivalent to daylight. It is for this reason that Dufaycolor transparencies intended for use as lantern slides should be bound up with a sheet of the palest blue Cellophane, or projected through a colour filter in order to compensate for the difference in lighting.

The Final Result.

Provided that the exposure has been correct, and the transparency is not unduly thin or clogged up with an excess of black silver as a result of under or over development, the result ought to be faithful to the colours of the original subject. It will be seen that this depends not only upon the photographer, but also upon the lighting conditions under which the subject is photographed, and those under which the result is examined.

August 25th, 1937

Pictures on

By D. SWAINE.

More Holiday Subjects

is ideal, as the continual change of scene keeps the attention always on the alert for suitable subjects, and prevents that feeling of staleness, and lack of interest in the surroundings, that arises when the same scenes are visited day after day.

With the continual improvement in the roads, photographic opportunities are passing. An improved

AT EASHING, NEAR GODALMING.

FROM a town to the beach, and at the end of the holiday back again to the town. Such is the holiday programme of most people, who spend their time so exclusively by the sea that they never even become aware of the attractions of the countryside so short a distance inland. Yet there is hardly a holiday resort, no matter how large and busy, that is not within very easy reach of country roads and lanes that will offer the photographer picture after picture as he makes his way from one village to another on a day stolen from the delights of the beach.

Those, of course, whose holiday is taken on the roads, motoring, walking or cycling from place to place, will inevitably find on their journeyings many such subjects as those reproduced here. For the photographer, this type of holiday

SUNLIGHT IN OLD SALISBURY.

INTO THE VILLAGE.

High-contrast subjects such as this need shortened development.

road pleases the motorist (fair enough, since he pays for it), but pictorial subjects are rare on arterial roads. Granted that the highway authorities are doing much to minimise the naked ugliness of these new roads, nevertheless they can never bring that joy to the heart of a photographer which is his at the sight of a gentle, tree-lined curve, with sunshine and shadow playing upon an old cottage. There is such a wealth of material! All the year round, too, if one cares; but

Highways and Byways

Country scenes such as this are within easy reach of nearly every holiday resort, and offer an attractive alternative to the more usual pictures of the beach.

THE CORNER HOUSE.

Slow Panchromatic film, K2 filter.

undoubtedly the summer months are the real days of the open road; the days when it becomes a "joy to travel rather than to arrive." And one travels hopefully, for once the mind becomes attuned to the possibilities of this type of picture, there is always the anticipation that rounding the next corner may bring "a beauty" into view.

The holiday period is quite the best time for the photographer who is tied to business during the week. He will find himself in the country during work days, and so will have a good chance of completing a sound composition by the inclusion of a farm cart or a flock of sheep moving to the pastures. Cattle also are always brought in to milk during the afternoon, while haymaking and harvesting will at least give a possibility of finding suitable interest in the right place at the right time. On one or two occasions, having noted a good arrangement of trees and lighting, and seeing work proceeding in the fields a little farther along, I have crossed to enquire if the return to the farm would take the labourers with their teams past the setting

IN A DORSET BYWAY.

I had in mind. If this was so I arranged to return.

Technically, these charming "bits" of highway and byway offer no special problems. But where strong sunshine and heavy shadows enter into the composition development may have to be curtailed considerably, especially if the foreground is one of the untarred lanes still to be found in some country districts. These reflect an immense amount of light when under full sunshine, and unless care is taken in development they will appear as blank white areas in the final print.

WHERE THE
ROAD ENDS.

THE ROAD OVER THE HEATH. *Slow Panchromatic film, K1 filter.*

Readers' Hints, Tips and Gadgets

A QUICKLY-ADJUSTABLE STRAP.

when in use. Passing round the neck, this strap should be of such a length as to allow the camera to hang at about the level of the top button of the waistcoat. It needs, therefore, to be very much shorter than the carrying-strap.

The illustration shows a means by which the shoulder-strap may be shortened at a moment's notice to form a neck-strap. About halfway along its length, a hole is punched and a stud inserted. Near one end, at a point depending on the exact degree of shortening required, is sewn a leather tab which has a hole to take the stud. The strap can be shortened in a matter of seconds by fastening the loop on to the stud.

H. BARLOW.

FILTER YOUR SOLUTIONS.

THE black mass in the stalk of the funnel shown in the illustration is a plug of cotton-wool, originally white. It has been used once only to filter a solution made from one pound of acid-fixing salt of good quality. The discoloration gives a very good idea of the amount of foreign matter present.

Dirt of this character seems to be inevitable. The wise photographer filters all his solutions as a matter of routine, so that nothing shall be present in them which could possibly damage the delicate surface of his sensitive materials.

A filter holder of the size to hold the funnel can be constructed easily of a block of wood and stout wire. The one illus-

trated is a better finished affair with adjustable holder, but plain wire bent as requisite will serve the purpose just as well and can be kept at hand for regular use.

H. ASHLEY COX.

MANY cameras nowadays are carried in cases from which they are not removed for use. When just being carried, the strap should pass over one shoulder and allow the camera to hang level with the elbow of the opposite arm. But it is usually preferred, especially with reflex cameras, to have the camera on a neck-strap

SAFETY WITH PANCHROMATIC FILMS.

BEING the owner of an old model Baby Ikonta which was not safe for pan. film, and getting rather fed up with the window covers provided with the films, I devised the following method of making the camera safe without their use. All the measurements given here are for the Baby Ikonta, but the idea can be adapted to most folding cameras without pressure plate, by suitably altering the measurements.

First cut a piece of thin notepaper 3 in. long by 2 in. wide, and draw two pencil lines $\frac{5}{16}$ ths in. from each end, as at A in the lower drawing. In the middle mark out an oblong $1\frac{7}{8} \times \frac{5}{8}$ in. When cut out this covers the back of the camera, and the oblong space allows the film numbers to be seen through the windows. Obtain half a yard of black ribbon-velvet 2 in. wide and cut off a piece 3 in. long. The paper design is now stuck on to the back of the velvet, design outwards, and given plenty of time to dry. It is necessary to back the velvet with paper before cutting, or it will be found to fray badly.

When dry, the design is cut out with an old safety-razor blade along the lines marked A in the lower drawing. The paper backing is now coated with

glue (I have found "Croid" very satisfactory) and stuck to the back of the

camera. See that the oblong space is an even distance from the red windows

all round. Take great care to get no glue on the face of the velvet and leave the glue at least a day to dry.

When the film is placed in the camera the velvet pressing on the red paper of the film traps any light entering through the windows. I have had the velvet in use in my own camera for over a year now, and have never had any trace of fogging since I fitted it.

To equip other cameras in the same way it is necessary to measure the distance between the back of the camera and the rollers over which the film passes. To do this, cut about six strips of ordinary white postcard $\frac{1}{2}$ in. wide and long enough to lie on the rollers. Stick three of these together and, when dry, lay them on the rollers and close the back of the camera gently. If it shuts normally and the card offers no obstruction, add more strips until gentle resistance is felt just as the back shuts. If it is necessary to add one loose strip, a piece of postcard should be cut as the lower drawing and placed behind the velvet; for two strips two pieces of card will be required behind the velvet, and so on. The three cards stuck together are the thickness required for the velvet and paper.

N. G. THACKRAY.

WHAT WERE YOU ARE YOU SATISFIED? TAUGHT?

If you have already had your holiday, you will by now have learned whether that new camera you bought to take away with you really is worthy of the faith and trust you placed in it. You know now whether the lens covers at full aperture; whether the definition is as sharp at full aperture as you had hoped it would be; whether the shutter is really reliable on all settings; whether the general operation is as speedy and convenient as the camera of your desires should be; whether—ah, well, we could go on indefinitely in this strain; the main thing is

If not, why not? If not, why not let us know all about it? Come to us, lay your head sadly on our breast, and, with heaving shoulders, sob your poor heart out to us! Tell us just why you're feeling "pipped," and let us endeavour, stroking our venerable white whiskers the while, to make sure of your getting a camera really worth having.

We will gladly take your present miniature in part exchange, the allowance representing the deposit against any other camera that may interest you. Any balance payable could then be spread over any period up to two years, and our arrangements for hire purchase are very tactful and friendly. As regards allowances, we have often been told that ours are the very best obtainable anywhere, so why not "Try 202 for Service?"

SPECIAL OFFER

We have now in stock three only Compass Cameras which we are obliged to sell as second-hand owing to their having previously been issued, but which are to all intents and purposes brand new, since we have only just received them back from the manufacturers, who have altered them to conform to the specification of the very latest model. The price of the cameras is £19 10s., and as we do not anticipate having them in stock for any length of time, prospective Compass users are advised to get in touch with us at once in order to discuss straight away the exchange of their present miniature apparatus and, if required, the hire purchase arrangements.

LEICAS :

Leica IIIa, f/2 Summar lens, E.R. case. As new £35 10 0
Leica III, chromium, f/2 Summar, E.R. case. As new £32 10 0
Leica III, black, f/2 Summar, E.R. case. As new £31 10 0
Leica III, chromium, f/3.5 Elmar, E.R. case. As new £24 17 6
Leica III, black, f/3.5 Elmar, E.R. case. Practically as new £23 17 6
Leica II, chromium, f/3.5 Elmar. Indistinguishable from new £22 15 0
4-cm. f/1.5 Plasmal for the Leica, uncoupled. As new £12 15 0
5-cm. f/1.5 Plasmal for the Leica, uncoupled. As new. Cost approximately £30. £14 10 0
3-in. f/1.5 Plasmal for the Leica, uncoupled. Cost approximately £36. As new £19 10 0
Hektor f/6.3 2.8-cm. Ultra Wide-angle Lens, chromium. As new £8 10 0
Special Finder for above, chromium plated. As new £2 12 6

CONTAXES :

Contax Model III, f/2 Sonnar, E.R. case. As new £52 10 0
Contax Model II, f/1.5 Sonnar, E.R. case. As new £55 0 0
Contax Model II, f/2 Sonnar, E.R. case. As new £42 10 0
Contax Model I (this year's pattern), f/2 Sonnar. As new £32 17 6
Contax Model I, as above, but fitted f/2.8 Tessar £25 17 6
Contax, as above, but fitted f/3.5 Tessar. £23 17 6
Contax, old non-slow-speeds model, f/3.5 Tessar. Good condition £14 17 6
8.5-cm. f/2 Sonnar for the Contax, any model. As new £24 17 6
F/8 Wide-angle Tessar for the Contax. As new. Chromium £19 17 6
Plate Back, with 1 slide for Contax I £2 19 6
Ditto, for Contaflex £3 7 6
Contameter for the Super Nettel. As new £6 19 6
4-cm. f/2 Biotar for the Contax. As new £13 10 0
Biogon, in Contaflex mounting, f/2.8, 3.5-cm. As new £16 10 0

MINIATURE CAMERAS FITTED WITH COUPLED RANGE-FINDERS :

Super Ikonta, Model 530/15, f/4.5 Tessar (ideal for colour work). As new £13 10 0
Another, as above, but with Rapid Compur shutter. As new £14 0 0
Super Ikonta 530/2, f/3.8 Tessar, Rapid Compur. As new £16 17 6
Super Ikonta 530/2, f/4.5 Tessar, Rapid Compur. As new £13 18 6
Super Ikonta 530/2, as new, f/4.5 Triotar, Klio shutter £9 17 6

OH, FRABJOUS JOY!

We're not quite sure whether the incomparable joy of handling the Robot can be called "frabjous," but, whatever you may call it, it's still a joy, and a very real one, at that! The camera really is a pearl without price—a delight for ever!

Write for full particulars right now! The prices range from £23 10s. to £29 10s., and the cameras are more than well worth it.

MINIATURE CAMERAS FITTED WITH COUPLED RANGE-FINDERS—contd.:

Super Ikonta 530, f/3.5 Tessar, normal Compur. As new £13 17 6
Super Ikonta 530/16, f/2.8 Tessar, Rapid Compur. As new £23 17 6

Model II Super Nettel, f/2.8 Tessar, case. As new £22 17 6
Ensign Multex, f/3.5 Ensar, case. As new £12 17 6

WE 'ANG OUR 'EADS IN SHIME!

Oh, it's cruel 'ard! There we were, so proud of ourselves because we were the first to offer Champlin 15 in concentrated solution, and then some nasty, hypercritical critic decides that he doesn't like the "get-up" of the outfit, or the colour of the solution. However, bowing to the storm of his wrath and righteous indignation, we have produced such a solution, and such a make-up, as would make Harry Champlin proud of us!

Send to-day for a bottle, and try it! All that is necessary is the addition of water to the 100 c.c. of concentrated solution. It is the only superfine grain developer so easy to prepare, and the price is only 4s. 9d. per bottle, with postage 6d. extra.

MINIATURE REFLEXES :

Latest Automatic Rolleiflex 4×4 cm., f/2.8 Tessar, Rapid Compur. As new £19 17 6

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

A HOLIDAY ABROAD By GORDON P. FOSTER.

TYROLEAN VILLAGE STREET.
Lans, near Innsbruck.

LAST summer my good fortune to be able to take a holiday abroad suddenly awakened a new interest in life, namely photography. Although I had hardly exposed a dozen films up till then, the knowledge that I should see many beautiful things which possibly I should never see again made me quite determined to bring as much as possible of my holiday home with me in the form of pictures.

As I was intending to move about from place to place, and to do a good deal of

exposures to the roll seemed the smallest of any, so my choice fell on an unpretentious V.P. camera of first-class make.

When travelling abroad the complete unfamiliarity of nearly everything one sees has the effect of stimulating the perceptions to a remarkable extent, and photographic subjects seem to arise at every turn. Even an ordinary everyday suburban house differs in style from its English counterpart, and demands to be added to the collection of holiday records, while away from the larger centres

ACROSS THE VALLEY.
View of Unt-Seefeld.

in consequence look like trees and not, as in so many mountain pictures, like shrubs.

The very essence of "foreignness" is shown by the centre picture, "Tyrolean Landscape." The church, the farmhouse, and the landscape itself have an atmosphere unmistakably un-English, and therefore attractive to the holiday-making visitor.

TYROLEAN LANDSCAPE.
Looking down on Mosern.

of population, where architecture and customs are more individual, subjects are infinitely numerous.

My holiday was spent in the Tyrol, and in the mountains and among villages rather than in the towns. The village street, with the cow drinking at the trough in the foreground, is so different in atmosphere from anything one could find at home that it was impossible to pass by without making an exposure.

Mountains, impressive though they are to the eye, are inclined to be uninteresting unless a foreground is included. Without it, there is nothing to give scale to the view, and in the clear mountain air the mountains look small and near rather than huge and distant. In "Across the Valley" the foreground village corrects this wrong impression, and the trees clothing the mountain-side

WORK ON THE MOUNTAINSIDE.
The Inn Valley, seen from Mosern.

walking, portability in my camera was a matter of considerable moment. My scanty previous efforts had been concerned with a larger camera, but for this trip I decided to start fresh with a better and more pocketable instrument. For the size of picture it takes, a camera using standard V.P. film and making eight

IN OLD INNSBRUCK. The mountain forming the background seems to rise almost from the street itself.

A Miniature Exposure Meter

By
JOHN COLE.

CORRECTNESS of exposure is very necessary in miniature work, but to carry around even the smallest exposure estimator is to destroy one of the great charms of the truly miniature camera—its lack of bulk.

This note describes a bulkless and comprehensive exposure table which, since it is always with the camera, cannot be mislaid. No camera is too small to take it.

With each Selo "pan" film is given a piece of adhesive plaster for fitting over the red window of the camera. It has a circular hole in the middle, and attached to it there is an opaque flap with an adhesive edge. One of these little covers should be saved, and the circular aperture should be enlarged with a sharp penknife to a rectangular opening of 14 mm. x 20 mm. Next a piece of paper should be cut to 2 mm. larger each way (i.e., 16 mm. x 22 mm.). On this piece of paper should be written (preferably in indian ink with a mapping pen, although the writer's was written quite easily with a coarse fountain-pen) the few details shown on the accompanying table. Finally, the paper should be stuck to the adhesive tape

(so that the writing shows through the rectangular aperture) and the adhesive tape stuck to a convenient flat surface on the camera body.

The illustration shows the gadget fitted to an Ensign Midget, one of the smallest of miniatures.

The table, drawn up as shown, gives much more information than is at first sight apparent.

The first column gives the time of day. In point of fact, only the morning figures need be given, since the difference between those and 12 (13 during Summer Time) gives the afternoon figures. Thus, the particulars given for 9 a.m. are valid for 3 p.m., those for 10 a.m. serve till 2 p.m., and so on. The succeeding columns give the apertures that should be used for the various subjects with an exposure of $1/25$ th sec. The exposures in the last column also give fine cloud effects with a $2\times$ filter in use.

The apertures are such that each requires an exposure twice that of the next smaller one to it, i.e., $f/16$ requires twice that of $f/11$, $f/11$ twice that of $f/8$, and $f/8$ twice that of $f/6.3$. Consequently, if an exposure of $1/50$ th requires to be given in any particular circumstance (i.e., a half of $1/25$ th), the next larger aperture than the one indicated is used, e.g., $f/8$ instead of $f/11$.

Again, the figures are based on conditions of bright sunlight. If the sun is obscured by light clouds, twice the exposure is necessary, so that the next larger aperture is used. If the day is dull, a further doubling is called for, and if very dull, still further doubling. If a $2\times$ filter be used, that also necessitates a doubling. Thus it is necessary to remember only that every factor involved (i.e., progressive deterioration in light value, exposure speed and

filter) requires a multiplication by 2—never any other figure.

For example, supposing exposure details are wanted for a middle-distance picture of a lively kiddie, "with" the light, at 10 a.m. on a day when the sun is casting weak shadows. The basic aperture by the table is $f/11$. The next smaller aperture has to be used because the sun is weak. That brings us to $f/8$.

Time	P. Ag.	P.W.	Mid. Ag.	Mid. W.
11-3	6.3	8	11	16
10 & 4	6.3	8	8	11
9 & 5	—	—	—	11
8 & 6	—	—	—	6.3
7 & 7	—	—	—	—

NOTE.—The above table is all that needs to be carried. The user has to remember that:

P. Ag. means portrait against the light.

P.W. means portrait with the light.

Mid. Ag. means middle-distance subject against the light.

Mid. W. means ditto, with the light.

Instead of $1/25$ th at $f/8$ we prefer to use $1/50$ th at $f/6.3$ because nothing slower than $1/50$ th will arrest the child's quick movements. Incidentally, a not unimportant advantage of working always at the slowest permissible speed is that one then automatically works at the smallest possible aperture and secures the greatest depth of focus.

The table here illustrated is for August, and assumes the use of a film of medium speed. The writing out of a fresh table for each month and the fitting of it to the camera is but the matter of a few moments; the figures can be obtained from "The A.P." Monthly Exposure Tables, or any other reliable source.

A Pocket Case for the Miniature Camera

By L. S. P.

THE compactness of most miniature cameras makes them very easy to pocket—without their case. Generally the handsome and excellently made leather cases increase very considerably the overall dimensions of the camera, and the unobtrusive bulge in the pocket becomes a rather bulky article which is a decided nuisance.

In the struggle between care of the camera and the desire for as small a pocketful as possible, expensive models are frequently shoved in without their cases (thus being exposed to all the dust and grit which is always present in the linings of pockets). This does no camera any good, as the following test will show. Most photographers have a magnifying glass of some description in the house. Turn a pocket inside out and study it through the glass.

Nice sort of place to keep an expensive piece of delicate mechanism? Surprising how such stuff gets there? Never put a camera in there again? Well, one way of effecting a compromise is carefully and frequently to brush out one pocket in each suit. If the camera is then always kept to the "clean" pocket, and nothing else is ever put in it—far less harm is likely to result. Some people go a step farther and have a chamois lining made to fit in the pocket, attached by buttonholes to buttons stitched to the pocket lining. This extra lining can be washed frequently, and the only point to note is that it should be fully as deep as the pocket itself, so that the camera weight is taken by the original pocket lining, to avoid "drag" on the garment, which would be a continual reminder of the camera.

August 25th, 1937

Modern Miniature Cameras

THE VAUXHALL SUPER-MINICAM.

THIS new camera is a development of the Vauxhall Miniature reviewed in our issue of May 5th last, the development consisting primarily in adding a coupled range-finder.

The camera uses standard $2\frac{1}{2} \times 3\frac{1}{2}$ film and makes, at the option of the user, either 12 pictures 6×6 cm. or 16 pictures 4.5×6 cm. on each spool. In spite of the comparatively large picture taken, the camera itself is by no means bulky. Its dimensions are $5\frac{1}{2} \times 3\frac{1}{2} \times 1\frac{1}{2}$ in. over all projections, including the range-finder, and its weight is 23 oz.

The camera is self-erecting, opening to the infinity position on touch of a button. The front of the camera, which is quite rigid when extended, carries a 7.5-cm. Rodenstock Trinar anastigmat of maximum aperture $f/2.9$, mounted in a Compur Normal shutter. This is speeded to $1/250$ th of a second and is fitted with a delay action.

The shutter release is operated by a plunger which projects above the lensfront. In use, this is considerably more convenient than the usual trigger, as it can readily be operated while the camera is held firmly at eye-level with both hands. In this position the third finger of the right hand falls almost naturally on to the release.

Focussing is controlled by a lever projecting from the front of the baseboard. This lever is attached to a slotted plate in such a way that on moving the lever the lens front moves forward as a whole, being carried on a metal chassis sliding over the baseboard.

The range-finder, which is operated from the back of this chassis, is of the coincidence type, a brighter rectangle in the centre of the field of view showing a double image of any object upon which the camera is not actually focussed. Objects are seen natural size, neither magnified nor diminished, when viewed through the range-finder.

Focussing by scale can be used as an alternative to focussing by the range-finder if desired, the scale being graduated for distances to 4 ft. A point of interest is that as soon as the side struts are pressed to close the camera, the focussing springs back automatically to infinity. There is, therefore, no danger of straining the camera in any way by attempting to close it with the focussing set for near objects.

The view-finder, which is built into the range-finder casing, has a square mask with the corners indented to indicate the boundaries of the 4.5×6 cm. picture. It is of enclosed optical type, and gives a clear and brilliant image.

When loading the camera it is necessary to decide whether 12 or 16 pictures are to be taken on the spool. In the latter case a small mask provided with the camera has to be fitted into the square picture opening to reduce it to the smaller rectangular shape. Apart from this point the camera is loaded in the conventional manner, self-locking swing-out spool-holders making the insertion of a film easy. The back of the camera is equipped with three windows, one of which is used with spools bearing numbering from 1 to 12 for the production of 6×6 cm. pictures, while the other two are used in the manner customary with the "16-on" camera when making pictures 4.5×6 cm. All three windows are simultaneously opened and closed by a sliding shutter.

The Super-Minicom, which is obtainable only with the lens and shutter equipment described, is sold at £11 15s., which is a very moderate price for a camera with this specification. It is obtainable from The Camera Company, of 320, Vauxhall Bridge Road, S.W.1, and from the same firm's branch at 52, Cheapside, E.C.2.

Miniature Camera Gossip

By LANCELOT VINING.

THE dress rehearsal of the London Casino's new show did not supply as much material for the test of my improved flash-gun as I had hoped, as there were only two or three turns which could not be obtained with the $f/1.5$ unaided. However, I have no complaints, and am very pleased with its easy and sure working. The movements are now reduced to four: placing lamp in holder, setting gun, setting shutter and exposing. I gave the Russian dancers, taken at 30 feet, $1/500$ th at $f/4$, using I.S.S.

I had quite a surprise whilst eating eggs and bacon in the Casino kitchen at 3 a.m. My neighbour, a very charming American blonde, dressed for a heat wave, asked me to compare the speeds of Du Pont Special

of films; here is their latest information.

Each tin of film is sold with a serial number stamped on it. The new series commence with the following numbers: Isochrom F, 392/—; Isopan FF, 397/—; Isopan F, 398/—; Isopan I.S.S., 399/—. Make a note of these numbers and you will know next time you are buying film whether you are getting the old or new series.

In developing, all but the I.S.S. must have 25 to 30 per cent less time than you have been giving the old series, whatever the developer you may be using. You will have to find by experiment what exact reduction will give you the contrast you desire, but I fancy that the 30 per cent will produce a negative of gamma in the region of 0.7. The development time for I.S.S. officially remains as before, but I have found that for my work a 10 per cent reduction for the new series does no harm.

A Rare Handful.

I have now received a $7\frac{1}{8}$ -in. (18-cm.) Sonnar $f/2.8$ for trial. In my first test I exposed with the aid of my unipod as shown in photograph. I was hoping that it would be possible to expose

AN 18-CM. $f/2.8$ LENS ON A CONTAX. Note the support used in an effort to dispense with a tripod.

and I.S.S. You never know who uses a miniature these days.

Agfa New Series Films.

Some weeks ago I asked Messrs. Agfa if it was not possible for them to clear the air a little regarding their new series

in this manner, but results prove that a tripod must be used and it will have to be a very steady one.

I did not find focussing very easy, as the side of the lens cuts into the yellow rectangle of the range-finder. I hope to tell you more about the results next week.

TEN GUINEAS AND UNDER

A Section for the User of the
Inexpensive Miniature.

Portraiture Out of Doors *By S. W. JARVIS.*

MY first portraits, taken indoors by the light of a single 100-watt bulb, on super-speed pan. film, were not at all successful, being coarse and grainy. Even with a fine-grain film, I found that enlargement of about a third of the tiny negative to half-plate size caused a slight but noticeable break-up of the image, which was small on the film owing to my having taken the portraits at 6 ft. distance with a view to ensuring good perspective.

It seemed that a contributing cause of the general unsharpness might be that I was using a light rich in red and rather poor in blue rays. I had read that blue and ultra-violet rays register on the surface of the emulsion, and that red and yellow rays penetrate more deeply, causing in a thick emulsion a slight diffraction or scatter in their passage.

The outcome of a series of experiments was that I chose to use daylight instead of artificial light. Moving closer to my subjects, I found it quite possible to take portraits free from noticeable distortion of perspective at 3 ft. 6 in. Very close close-ups at 2 ft. 6 in. show traces of this fault. Fig. 3 was taken to illustrate the point.

Fig. 2 shows the advantage of posing the subject in the open with only a neutral-tinted sky behind. Fig. 1 was taken in an open-fronted summer-house with a plain sheet as a background. The roof provided a shaded effect, and prevented too much top light.

ABOVE. Fig. 1. Taken in open summer-house at 4 ft. 6 in.

LEFT. Fig. 2. Taken in open at 4 ft. with sky as background.

Both these are from parts of 3x4 cm. Kolibri negatives.

I find it very advisable to use a tripod. A good wooden one perhaps looks a little clumsy below a miniature, but its rigidness at any setting of the legs is a great asset for portrait work.

Another desirable accessory is a range-finder. It can be screwed into the tripod-socket, and will enable the user to secure sharply defined negatives every

time. Any desired degree of diffusion can be obtained later on in the enlarging stage.

The view-finder fitted to the inexpensive miniature usually shows a little less of the subject than will actually be taken, but definite allowance should be made for parallax by making sure that the view-finder includes a good two inches above the picture that is wanted on the negative. There will then be no chance of decapitating your sitter.

Fig. 3. Showing distortion at too short range. Taken at 2 ft. 6 in. with 3x4 cm. Box Tenger.

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

A HALF-PLATE ENLARGER.

I have a 1/2-pl. horizontal condenser enlarger, which I should like to use for enlarging from Leica-size negatives. Where can I buy, or how can I improvise, a masking holder with combined focussing magnifier to take 24x36 mm. negatives in strips of four?

R. A. B. (Reading.)

Before you go any farther with your scheme of using a half-plate enlarger for miniature negatives we suggest that you sandwich a negative between two glass plates and make a practical trial of enlarging from it. We think you will then be convinced that the use of this enlarger is going to be, if not impracticable, at least extremely inconvenient.

Two glass plates hinged together by adhesive tape and fitted with a paper mask will make a satisfactory carrier. If you require a focussing magnifier it should be attached to the easel, not to the negative carrier.

DEPTH OF FOCUS.

In a recent article under "Miniature Notes" the author wrote that "the required depth of focus is obtained by adjusting the stop according to the table embossed on a metal plate on the back of the camera." My camera has no such embossed plate; will you please tell me where I can get one?

P. K. E. (Earls Court.)

You do not mention either the make or the size of your camera, but you might be able to get a depth-of-focus table to suit it on application to the makers. There is no such thing as a table that is applicable to all cameras, as your query seems to imply.

If you refer to our Facts and Formulae Nos. 60 and 61 (issues January 27th and February 3rd) you will find instructions for working out a complete depth-of-focus table for any camera.

DAYLIGHT TANK FOR 35-mm. FILM.

Can you tell me how I can develop 36-exposure lengths of 35-mm. film in daylight? Is there any method like the popular daylight-loading tank as used for ordinary roll films?

H. R. (Hendon.)

In our issue of June 2nd last there was a complete list of tanks for developing roll films, and this included 35-mm. film as used in miniature cameras. A description of each tank was given.

There is only one daylight-loading tank for that size film—the Super-Kino, sold by the Norse Trading Co. (London), Ltd., of 37, Rathbone St., W.1. The remaining tanks can be used for development in daylight, although the film has to be put into them in a darkened room or cupboard.

ONLY TWENTY EXPOSED.

I have made 20 exposures with my Leica, and have wound the exposed film back into the cassette. I want to have the exposed part developed and then to go on and use the rest, and several dealers I have asked to do this for me say it cannot be done. Can you help me, please?

H. B. D. (London.)

Each exposure taken with a Leica camera is 38-mm. long, including one space between successive negatives. Twenty negatives will thus occupy a length of 760 mm., and, if you measure off from the film this length, plus an allowance for the trailer used in loading, you can have this part of the film developed by itself. The remaining piece can be retrimmed before reloading.

DOLLINA CAMERAS.

I believe that Messrs. Actina Ltd. are agents only, and not makers, of the Dollina II camera. Could you give me the name and address of the actual makers in Germany?

C. D. B. (Malta.)

You are correct in assuming that Messrs. Actina Ltd. do not manufacture the Dollina II camera. The makers are the Certo-Kamera-Werk A. G., Dresden, Germany.

THE EDINEX CAMERA.

I should be very grateful if you could tell me the make and speed of the shutter used on the Zodel "Edinex" camera (10-guinea model), and the size of picture this camera takes.

A. M. S. (Birmingham.)

The Zodel Edinex camera takes pictures 36x24 mm., and is fitted with a Compur-Normal shutter, speeded from 1 to 1/300th second. This camera was reviewed in our issue of March 31st last, and for further details we would refer you to this review, and to Messrs. Wallace Heaton Ltd., of 127, New Bond Street, W.1 who are agents for the camera in this country.

Leica

 WITH

XENON LENS F/1.5 RAPID WINDER

This equipment is geared to the tempo of modern times. It enables you to take snapshots at night and indoors, with machine-gun rapidity, of your children at play and your pet animals frolicking. How often have you missed such chances which abound but cannot be taken with ordinary equipment. The Leica is the handiest and smartest of miniature cameras. Constantly fostering progress, it copes with every photographic need.

"Leica News and Technique," a bi-monthly illustrated journal, is distributed free of charge to all Leica users in Britain who register their camera number with us. A specimen copy is gladly sent free of charge to anybody interested.

E. LEITZ (LONDON), 20, MORTIMER ST., LONDON, W.1.

COLOUR

is no longer expensive

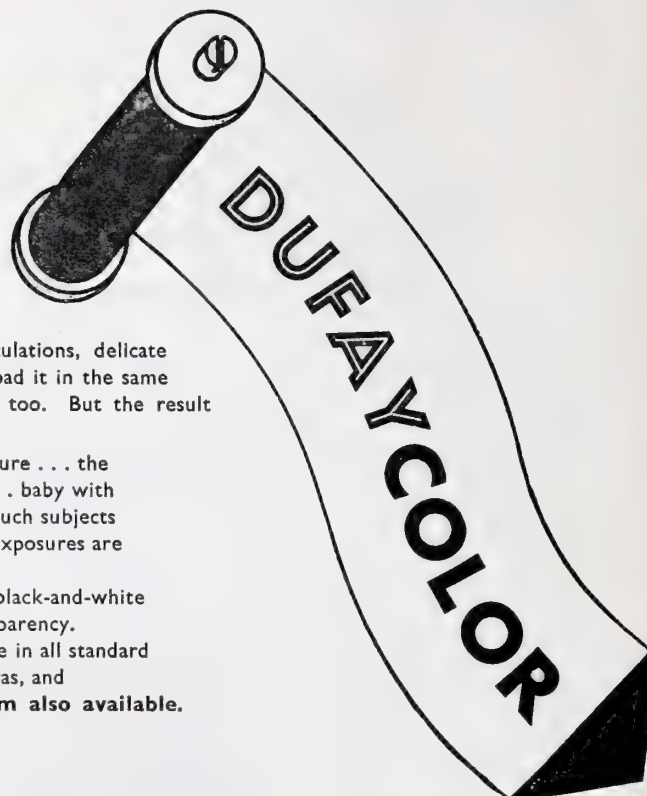

No longer does it mean long exposures, intricate calculations, delicate filters. DUFAYCOLOR does away with all that! You load it in the same way as ordinary film. You expose it in the same way, too. But the result is—natural colour!

DUFAYCOLOR puts the glow of life into the simplest picture... the picnic-party in the hayfield... the roses in your garden... baby with his sand-castle. 1/25 sec. at f.8 gives ample exposure for such subjects in the middle of a sunny day—while on dull days, though exposures are naturally longer, results are equally brilliant and life-like.

Your exposed film is developed by us, and any number of black-and-white prints can be made in addition to the original colour transparency.

Buy a DUFAYCOLOR film or pack today! They are made in all standard sizes, including 35-mm. film for Leica-type miniature cameras, and sub-standard cine film. 16-mm. and 9.5-mm. Ciné Film also available.

Obtainable at all Photographic Dealers.

PILOT "6"

ROLL FILM REFLEX

Although amazingly inexpensive, the Pilot "6" is a real reflex camera in every sense of the word, and gives you the same working efficiency as much more costly apparatus. It takes 12 exposures 2½ in. square. Shutter speeds 1/25th, 1/50th and 1/100th sec., also B. and T. Focussing on ground-glass screen with deep hood, a magnifier for fine focussing is provided. Full-size wire frame direct-vision finder for using camera at eye-level. Shoulder strap and wire release. Dimensions 3½ x 4 in. Weight about 22 oz.

No.	PRICE: £ s. d.	No.	PRICE: £ s. d.

SOAKING THE DARTBOARD.
The Volunteer, Sutton Abinger.

TO those of us who eagerly seize every opportunity to get out into the country, the inn is at once our resting and refreshment place and a club to which we are welcomed at our first entrance. In no way, perhaps, can the camera bring back to us more happily our all-too-brief excursions than in a record of "The Inn I Know."

Do you remember that dusty August morning when the sun was noon-hot by ten o'clock, and even the grass

cheese and a long, cooling drink. Isn't that haven worth a picture?

Then there was that little canal-side house you went to, not very optimistically, somehow. You had tea—bread and butter in good old-fashioned style, lettuce from the garden, tomatoes, and plenty of extra hot water with the tea. You stayed on, taking a swim in the water, watching old Harry selling his rather tired bunches of cornflowers in between letting an occasional boat go through the tiny lock. The stars came out, and you were still there. Eventually you stayed the night in the bargee's bedroom, and for the next day you hired a punt which you scrubbed out before breakfast. And all the time you had your camera with you, making records of the inn you knew.

A good many books have been written, and pictures

the day time, and the habitués of the place will be found surprisingly willing to co-operate in helping you to get your pictures (especially if you promise prints, as you should). Take a flash-bulb or two along, for with one of them almost anything is possible—a game of darts, a group of old shepherds come in from the Downs, shove-ha'penny with a thrilled crowd gathered round, or the inglenook where the oldest inhabitant

THE CHEQUERS, IGHTHAM.

takes his nightly pint. It is well to have a word with the proprietor before attempting this kind of work, but if he is consulted—and particularly if you are already known in the house—you will seldom meet with refusal, and can usually count on much help and friendly interest.

THE COB DEN ARMS, COCKING.

made, of the inns of England, yet if none of them is made by you personally, many of your favourite places and happiest memories must necessarily go unrecorded. Photographically, inns are easy things to take, though sometimes it may be a little difficult to get sufficiently far away, if the lane or village street is narrow. If your camera is one of those

which permits of the optional use of a wide angle lens, this difficulty ceases to be serious, and in any street wider than the merest alley you should be able to include all your subject. Use a filter if you can, particularly if the building is thatched or colour-washed, as so many of the most attractive are. And don't forget the interiors.

Many inns are well-lit enough to permit brief interior exposures during

THE THREE CROWNS, WISBOROUGH GREEN.

had an arid, parched look? You managed to take the shadiest route, through a wood here, along a tree-bordered lane there, but all the same by lunch time you were pretty hot, dusty and thirsty. And then round the bend of the road you caught sight of the inn which the map had told you was awaiting you at your journey's end. In two minutes more you were in the bar, cool and dark to your sun-tired eyes, ordering bread and

THE BULL'S HEAD, STRAND-ON-THE-GREEN.

Night Scenes with a Simple Camera

By R. GOODEARL.

NOWADAYS, when we are hearing so much about night photography with super-speed lenses and films, perhaps people with more moderate apparatus are apt to consider themselves out of it. While admitting that it is very fascinating to be able to take snapshots out of doors at night, it is realised that many people, owing to economic reasons, are unable at the moment to secure the fairly expensive cameras and

the exposures will be fairly long and the vibration of the camera likely to arise through wind would certainly cause blurring.

It is difficult to give much idea as to the actual lengths of exposures likely to be required, as conditions vary to a great extent, but some guide may be had from the illustrations. In any case, one or two trial exposures will pave the way.

Exposure Times.

All the photographs shown here were made at an aperture of $f/4.5$, so that the user of a box camera with a lens of about $f/11$, and using panchromatic

vehicles moving in the field of view will make an impression on the film in the form of streaks. A watch must therefore be kept, and the lens capped or covered with a piece of black card during their passage. People walking will not have any effect, although if they stand still for a time a ghost image will result.

Pictures in the Rain.

A wet night will provide interesting foreground reflections, but for protection the camera should be set up in a sheltered position, such as a shop doorway. If the desired viewpoint offers no shelter, the photographer should wear a mackintosh and hold an umbrella over the camera. In this way both he and his instrument will be protected from the weather.

THE LIGHT OF WELCOME.
5 mins., $f/4.5$, Soft Gradation Pan. Plate.

lenses necessary. It is then to these that this article is mainly addressed.

Almost any camera, even the humble box type with single lens, will be suitable, provided that a firm tripod and plenty of time are available.

Preparations in Advance.

If possible a visit should be made beforehand to different spots which are considered likely to yield pictures, and notes should carefully be made as to best viewpoint, times, type of weather needed, and any other points likely to save time and prevent indecision when actually taking the pictures. Care should be taken to see that very powerful lights are not in the field of view or likely to shine on the lens.

A calm evening is generally best for picture-making, as in most cases

THE SWAN INN.
10 mins., $f/4.5$, Soft Gradation Pan. Plate.

film, will have to multiply the times by six. Good results are obtainable on orthochromatic films, but of course the exposures will need to be considerably longer. If plates are used they must be backed, or bad halation will occur.

It must be remembered that when an exposure is being made lighted

How I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CD.

Mr. KENNETH I.
JOHNSTONE.

From information communicated to our Special Representative.

"AS a keen student of English Gothic Art, and especially in the form of mediæval wood-carving, I have found in photography an excellent medium for recording interesting examples of the carver's art.

"Architectural detail photography of all kinds requires absolutely perfect technique at every stage from the exposure of the plate to the production of the finished slide or enlargement.

"In the first place, much depends on the careful choice of apparatus, which is not exactly that which is commonly employed for general outdoor work. Owing to the inaccessible position of many of the most interesting subjects, whether interior or exterior, the worker must be prepared to use apparatus with high rising front, telephotographic equipment, and a high and very rigid tripod. Without these and other necessary requirements he will be obliged to restrict his activities to the already well-worn paths.

"My own choice of apparatus is, first, a quarter-plate Sanderson Regular, used mainly for misericords and bench-ends; and, second, a half-plate Gandolfi Imperial, with a rising front of $4\frac{1}{2}$ in. Both cameras take quarter-plates, a quarter-plate film-pack adapter and a $3\frac{1}{4} \times 2\frac{1}{4}$ Plaibel roll-film holder.

"Fortunately, lenses suitable for this special type of work are now readily obtainable second-hand. I use a Zeiss Tessar $4\frac{3}{4}$ in. with both Proxar and Distar attachments; a Ross Homocentric $5\frac{1}{2}$ in. and a Ross-Zeiss Convertible with 8-in. and 14-in. components. In addition to these I have a 13-in. Teleros, and an Adon Adjustable telephoto lens.

"The majority of my negatives are made on quarter-plate film packs, or on $3\frac{1}{4} \times 2\frac{1}{4}$ roll films of Isochrom or Panatomic emulsion; with half-plates in reserve for exterior work and interior work when

PANEL, MILVERTON CHURCH.
K. I. Johnstone.

both a general view and enlarged details are to be secured from the same negative.

"The question of exposure is of paramount importance, and the most useful aid in the circumstances

is to keep a careful record of all exposures made, including the character of the lighting and details of all conditions bearing on exposure.

"For the recording of carved woodwork I make extensive use of electric lighting equipment, both portable and mains-driven. Indeed, the successful photography of many misericords is impossible without the aid of artificial light.

"All plates and films are first desensitised in pinacryptol green, and developed in dilute pyro-soda by inspection, so as to produce a soft negative with an abundance of detail in the shadows.

"For exhibition prints I use 'Clorona' chloro-bromide paper almost exclusively, as it is possible to reproduce the tone and texture of wood or stone with great fidelity. In order to minimise the exposure required in enlarging, I employ a condenser enlarger with a Photoflood bulb as illuminant, the bulb being run in series with a second similar lamp, except during exposure, for economical reasons. Great care is necessary if satisfactory tones are to be obtained by the process, and the exposure, lens aperture, and composition and temperature of developer must all be carefully controlled.

"Retouching is frequently necessary in the case of unwanted high-lights and damaged carvings. This can be readily carried out with matched oil pigments after treatment of the print with poppy oil and purified turpentine, which process, of itself, adds greatly to the brilliance of the finished print."

(A further example of Mr. Johnstone's work is reproduced on one of the centre Art pages.)

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"CHOLESBURY MILL," by Dr. S. D. Jouhar.

GETTING the decidedly strong dark of the mass of the mill against a powerful sky has quite a good deal to do with the undoubted success this picture achieves. And that it is successful is shown by the fact that it secured the first prize in the competition recently organised by Messrs. Wallace Heaton, in connection with which the entries were both numerous and of a high standard.

Its quality and pictorial merit may therefore be taken for granted, but there is a good deal to be learned from the way the subject has been treated, and not a little from the manner in which the tonal scheme has been restricted or simplified.

The mill, in itself, has a fine upstanding shape and its body seems to have been treated with something in the nature of a highly reflective covering of a very dark local colour. With the strong prevailing sunlight, the contrast has been considerably heightened by these conditions so that the main mass is shown in very full tone, which stresses the roundness of the modelling, and the sides, which come against the sky, acquire a most unusual strength.

In between, the reflected light gains an extraordinary intensity. The roof and sails, too, are of a brilliant tone, the effect of which is emphasised by the adjacent darks, and, coming against the nicely graded sky, their isolation is complete and lends them a high degree of significance.

All these features, in different ways, stress the importance of, and so lend attraction to, the mill. In the first place, the eye is attracted by its shape; then by its contrast with the sky, and then by its internal conjunction of extremes of tone. Any strong dark or any strong light tends to attract the attention. Either, standing alone in a scheme of half-tone, is sufficient to endow the

item in which it is manifested with such a degree of importance that, assuming it is reasonably well placed, it is capable of serving the function of providing the centre of interest.

If then, as in this instance, the two extremes occur in the same element, the concentration of interest

also, to ensure its predominance. The attraction is therefore doubled, and, added to this again is the pull of the association suggested by the literary content. That is endowed with the romanticism of another age, and, if it does not actually help the composition, it increases the pictorial interest.

These features, in the main, become apparent when the picture is analysed. They would not, as a rule, enter into consideration when the subject was seen and taken. Then, I feel, they would be more or less instinctively or intuitively appreciated, and, if this interpretation should happen to represent the subject as first approached, the author was fortunate in securing so favourable a lighting, for it is on this that the happy arrangement of the light and shade depends. It may, however, have been the case that, at first sight, conditions were not so good, and, after the surroundings had been studied and a note made of the time when the lighting would be estimated to be at its best, the subject was left for the time being and the scene taken subsequently as the occasion offered.

The latter method, however, involves a capacity for visualising the effect of different conditions and takes a bit of acquiring, but, where the moods of nature or effects of a transitory kind are in question, it is better to make sure of them as they occur, for they seldom, if ever, recur in precisely the way that might be expected.

By whichever method this impression was obtained, however, its virility and appeal are undeniable, but, although it is a very minor point, I rather think the white window frame towards the right is inclined to be too assertive for its position, and toning it down a bit so that it does not hit the eye to the same extent would be wise.

"MENTOR."

so excited is most powerful, so much so that quite considerable liberties could be taken with the placing without impairing the unity of the composition.

But the placing of the mill—off the centre and distant enough from the edge to avoid any suspicion of weakness—is sound, and, quite apart from the concentration of interest exerted by the arrangement of the light and shade, has sufficient force of position,

CHOLESBURY MILL.

PICTURES by Novices

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page.

WITH the autumn fast approaching, the question of the rendering of colour in monochrome becomes increasingly important, for if we are to get a proper version of the golds and browns and reds of foliage at that season, it is practically essential that panchromatic material, in conjunction with a fully correcting light filter, should be employed.

Autumn Colours.

It may be that some sort of a show can be made with the ordinary run of orthochromatic plates or films if the conditions are favourable, but the results are by no means comparable with those that can readily be secured with the aid of "pans," and I, for one, would not think of going out for subjects in which colour is a feature with anything but plates or films of this latter variety.

Moreover, I would take jolly good care to take a light filter with me as well, knowing full well that if I should encounter a subject which, on account of movement, needed a shorter exposure than could be given with a filter, the material, without a filter, will give as good a rendering as could be obtained on any other kind, and, if colour should predominate, it is a simple matter to slip the screen over the lens. The fact that development has to be carried out in total darkness, no doubt, seems a bit of a drawback to the uninitiated, but the difficulties are largely imaginary, and anyone with any idea of systematic working can soon evolve a method suitable to his equipment and the particular kind of material in use.

Personally, I can load my slides with plates, take them out and put them in the developing dish, flood them with developing mixture and cover them up, or put a film in a tank, just as easily in the dark as I can with a safelight on. Once they are in and covered up, I turn the safelight on, take the time, and after the proper time has elapsed, I switch off and transfer to the fixing bath in total darkness again.

Clouds and "Pans."

I never see a plate or film till it is fixed, and a somewhat lengthy experience has convinced me that this is a much better—and safer—way than developing by inspection.

But the colours of autumn are not yet with us. There is still a little time, for those who have not already done so, to make themselves conversant with the treatment of panchromatic material, and it will be found that, in the rendering of the clouds that may be expected at this time of year or in the next few weeks, they are unrivalled.

No. 2 of the prints reproduced on the opposite page—"Clouds over Snowdonia," by J. A. Holdercroft—shows a pretty good sky, but the subject is fairly open, and, with a correct exposure, there would not be much difficulty in getting the clouds out with any of the modern ortho plates or films. "Pans," perhaps, would do it better, and would lose none of the finer subtleties of tone, but a sky like No. 5, "Storm Coast," by L. A. Camp, could scarcely have been obtained on any but this kind of emulsion and with an appropriate colour screen.

Pluck and Brilliance.

Knowing what the rendering of a subject like No. 2 could be, and comparing it with No. 5, there is no doubt but that, in my opinion, the latter is the better.

It does, as it happens, err on the side of a tendency towards an excess of contrast, but its pluck and brilliance of rendering compare most favourably with the inclination of No. 2 towards flatness, which, more particularly, is evident in the landscape portion of the subject. "Pans" would give an improvement in the representation of the sky, and, at the same time, the distinctions of the landscape would be more decisively depicted.

As far as the excess of contrast in No. 5 is concerned, that could be corrected by the substitution of a softer grade of paper for that employed, but the subject, and the effect, seem to have become popular of late, i.e., if the numbers of it that have been recently received are anything to go by. Still, it is a very good thing, and it is no wonder that it has attracted many exposures.

No. 6, "Cloverley Pool," by W. Renton Rogers, is another effort with a good sky, but in which the rendering of the landscape leaves a good deal

to be desired. The foliage, both near and far, is recorded in too dark a tone and is practically devoid of gradation. A "pan" emulsion, and a screen, would have provided a much improved tonal scheme.

Under-exposure and Over-printing.

Nos. 1 and 3, "Careened," by J. B. Lanchester, and "The Close of Day," by J. L. Ward, seem to me to be flat and muddy and gloomy.

The negatives are not before me, and without a sight of them I cannot be certain, but I have a strong suspicion that a considerable measure of under-exposure is largely responsible for their appearance, together with a degree of over-printing. Under-development may be a contributing factor, but this, again, is a thing that could only be determined from an inspection of the negatives.

It is not a difficult matter to distinguish between the two defects. If the darker parts of the subjects are shown in the negative as clear glass or film and there is little or no difference between them and the unexposed margins, under-exposure is the cause. If, however, the same dark parts show a distinct deposit in comparison with the margins but there is no appreciable density anywhere in the negative, under-development is to be inferred.

Faults and Remedies.

If under-exposure is the fault, there is no remedy but retaking the subject. Under-development, if the degree is not excessive, can be corrected either by the choice of a more vigorous grade of printing paper or by intensification.

With a subject like No. 4, "Trees," by W. Lee, where the trees are shown in silhouette against the sky, a certain amount of under-exposure would be permissible, for detail in the trunk and branches is not needed either to reveal their roundness of form or relieve their depth of tone.

This, however, is an exceptional case, and, in the main, under-exposure is a fault that must be avoided at all costs, for its effects are irremediable. Reference to our monthly tables will provide a good indication of what is needed, and, if there is any doubt about it, give double what you think ought to be given. "MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE
LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

SMALL DEFECTS IN ENLARGEMENTS.

I CANNOT help noticing that in many of the enlargements I see nowadays, and even in those of very moderate dimensions, there is marked deficiency in technical quality. Some of them show no sharper definition anywhere than can be obtained by using a "pinhole" instead of a lens; still more of them have a plentiful crop of spots, both light and dark, all over the picture, as well as even more serious blemishes.

There is no doubt that these defects are often due to making enlargements from very small negatives which are not by any means of the quality demanded in successful miniature work. It is safe to say that the smaller the negative the more perfect must be its quality, in definition, detail, gradation and freedom from even the slightest mechanical defects. Miniature work demands special knowledge and technique, and unless these can be acquired, it is best left alone. Inferior quality in a print cannot be

excused on the ground that the print was made from a tiny negative.

Some of the finest photographs ever produced are the result of miniature apparatus and methods; and whatever the apparatus and methods there is no valid excuse for slipshod work and defective results.

But with all our experience and care we cannot altogether avoid certain blemishes and defects. All we can do is to guard against them as well as we can, and learn to remedy those which do appear.

Recently I was horrified to find on

one of my prints a thumb mark well up to Scotland Yard standards. I set to work on it, and I am sure no one saw a trace of it in the reproduction in one of these articles. The moral is that we must avoid any marks, smears and "dirt" of any kind on our films or on the glasses between which they are sandwiched.

All my enlargements are made through masked sheets of glass, and these also need constant watching. I always keep a polishing cloth at hand, and use it constantly. Now and then I have been caught by a fragment of paper or something of the sort which has got on the glass, and made its mark on one or two prints before I have noticed it. The slightest flaw in the glass will also cause trouble.

In order to get both surfaces of my negatives as clean as possible I find it necessary to use a hardening bath. This in itself does not keep the surface clean, but it enables it to be cleaned without risk of scratches and other damage.

The beginner may prefer to make up an ordinary hypo bath, and then add something to it that will convert it into an acid hardening bath. Such a solution is supplied, for example, by Messrs. Johnson, one ounce being added to each pint of ordinary hypo solution.

Or here is the Ilford formula for a complete fixing bath. In 30 oz. of warm water dissolve $\frac{3}{4}$ lb. hypo and 1 oz. of potassium metabisulphite; and in another 10 oz. of warm water dissolve $\frac{1}{2}$ oz. of chrome alum. When both solutions are cool, add the

August 25th, 1937

second to the first. Always shake up well before use.

At the end of the washing each film can be laid at the bottom of a dish of clean water, and both sides swabbed with a plug of cotton-wool. The surface moisture can be removed with a flat pad of chamois leather, squeezed dry, while the negative is lying on a piece of glass. If it is then pinned up to dry out of the dust, everything possible has been done to keep it clean.

Even then there may be some spots, dark or clear, though most of them will be small. Clear spots, probably caused by dust specks on the film at the time of exposure, should be spotted out. I think the best way of doing this is to touch each one with the point of a fine crowquill ("mapping") pen and indian ink or Johnson's negative dye. A low-power magnifying glass aids this operation.

The idea is that it is easier to deal with light spots on a print than dark ones. These dark ones can be removed with a sharp-pointed lancet, but this removes emulsion as well, and the marks are visible, especially at an angle.

In the diagram the first square

shows an exaggerated rendering on a print of a clear spot in the negative; the second shows the white spot resulting from the blocking up of the pinhole with ink; the third shows the partial filling of the spot with stippled dots; and the fourth shows the finished result. In an actual print there should be no sign of a spot at all.

Many workers use pencils for this retouching, but personally I much prefer water-colour. If the print is to be "doped" afterwards, the water-colour does not shift.

The illustration shows a suitable palette. It has a large central pan, with four smaller ones round it. In one of these I put some water-colour lamp black, which matches ordinary bromide or gaslight prints. This is mixed dark enough to give a full black on the print, and I stir into it a drop or two of gum. In the next division is the same black, without gum. The other two divisions hold a rather warm sepia, one with gum and one without.

Of course the colours dry; but at any time I can take the palette, a brush and a little water, and spot either a black or a warm-tone print,

on either matt or semi-glossy paper. Colours from warm black to brown are matched by mixing more or less brown with black. The required depth of tone is obtained by taking a little pigment and more or less water and working it out on the central division.

The brush is important. Nothing is much use except a good-quality sable, and a No. 1 or a No. 2 is a suitable size.

It is a common mistake to take too much colour in the brush. Only the point of the brush is used, and there should be only enough colour to enable us to make a number of very small dots with the sharp point of the brush. This is known as stippling. Holding the brush nearly upright, its point is applied delicately and repeatedly to the spot to be treated (as suggested in the diagram) until it is no longer visible.

When the work is done, clean the middle of the palette, and put it away out of the dust; wash the brush, draw it to a point, and let it dry naturally.

Once you have acquired the knack you will never tolerate even tiny spots on a print. W. L. F. W.

PHOTOGRAPHY from a MOVING CAR By ERIC HERMAN.

WHEN on a motor tour it is often desired to get some photographs of the scenery whilst the car is in motion. In normal circumstances no one objects if the car is stopped for a moment while the photographer selects and snaps his picture. But if you are on a conducted tour, or on a shore excursion from a cruising liner when there are many cars in the same party, then you must either risk a snap from the moving car or go without the picture altogether.

When taking a photograph, sit loosely upright, not touching the back of the seat, and cradle the camera in your hands at eye-level. A direct viewfinder is practically a necessity for this type of work.

FIG. 1. Foreground obstructions are all too easy to include.

Use the highest shutter speed that the light will allow, and avoid too much foreground when taking distant views. If you wish to take something beside the road, try and get it by pointing the camera forward as you approach, not broadside-on as you go. Avoid also doing what I did when taking Fig. 1—I tried for a snap of another car on the road below us, but made the exposure just as a small stone post appeared; we passed these at such a speed, and they were set so close together, that it was difficult to miss getting one in the picture.

If your shutter is of the three-speed type, use the highest speed of which it is capable, and make the exposure on a turn, when the car is moving more slowly; meanwhile, you will have to swing the camera to avoid movement in the subject; but this "panning," as it is called, can be acquired after a little practice.

If you are travelling by charabanc, sit next to a window, and if possible lower it when making an exposure, in order to avoid taking the picture through the glass.

Should your car be a closed one, without a central seat, interesting snaps can be made from the front seat, through the windscreen, or from the back seat, including the driver's head in the view.

Finally, if your car is fitted with a sunshine roof, try doing what a friend of mine does; he sits on the back of the front seat, with his feet on the seat and his head projecting through the open roof. From this position he has an unobstructed view all round him.

FIG. 2. Even at 1/200th sec. this stream, taken broadside-on, is not really sharp.

MAKING BETTER SNAPSHOTS-12

By DAVID CHARLES.

This article is the twelfth of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

WHEN an attractive action subject such as that depicted here presents itself, it can be made into a very amusing competition among the camera owners present to see who gets the best results.

And such a competition usually turns out to be exceedingly instructive. It may not be the one who knows most about photography who wins. The person who has been used to taking his time over the selection of his viewpoint, the setting of the various adjustments of the

Fig. 1. Action-pictures need as much care with regard to background as any others. This is typical of the hasty shot, or of the beginner's effort.

Fig. 2. By asking her to look round, the whole effect of concentration on the game is lost. A very usual beginner's mistake.

Fig. 3. Accidents will happen, and even the expert may find on development that he has caught an impossibly awkward pose.

camera, and careful, deliberate aiming is very liable to discover when he is at last ready to shoot that the tug-of-war is all over and the combatants have retired from the scene. The excitable person, on the other hand, will be all agog to get his shot in first. He will forget all about observation of the background, and is as likely to face the sun as not. Fig. 1, unless he has "beginner's luck," will represent the measure of his success.

The Expert's Failure.

But, most peculiarly, this

Fig. 3a. This enlargement of part of Fig. 3 shows even more clearly the awkwardness of the pose caught. Also it shows that movement was quite rapid, as the figure is nowhere sharp.

quite unpleasing outline is as likely to come from the camera of a more deliberate worker. It must be remembered that a certain amount of time elapses between the thought, "This is the picture I want," and the fall of the shutter on that scene. Part of that period is occupied with the actual exposure of course. But by far the greater part of the period is occupied

Fig. 4. "Taking the Strain" is a moment of comparative inactivity, giving time for a very rapid check of the desirability of the pose before shooting.

by the action of the brain in making its decision, in issuing its command to the fingers to shoot, in that message travelling down the arm to the fingers, in the fingers accepting the message and performing their function, and in the travel of the exposing lever before the actual exposure takes place.

Time-Lag.

That period is called "time-lag." With some shutters it is slightly longer than with others; with many people it is very much longer than with others. In most people the time-lag between observing the pic-

ture they want and release of the shutter is long enough to let both the girl and the dog entirely change their poses.

Be Prepared.

Even the most practised action-photographer, prepared to seize his opportunities the instant they occur, is subject to the vagaries of fortune. He will not have winners every time, but his proportion of winners will be comparatively high. He is as liable as anyone else to find that a movement even swifter than his own has produced a result like Fig. 3, shown more clearly in the enlarged version of Fig. 3a; but if he is fond of curiosities he can always find a place for it in his album.

For the Deliberate Worker.

There are some who find that their mental and physical make-up fits them best for calmer activities than the rather hectic one of action-photography. And who will say that the picture of the peacemaking gift, after the war was over, has not as good a title to be considered for the prize as even Fig. 4, the best of the action shots?

Fig. 5. But the peacemaking after the mimic fight is still easier to photograph, and even the expert snapshotter tends to concentrate on these stationary poses. The result is so much more certain.

Records that are Pictures

By F. W. MURRELL.

Holiday snapshots are often not as interesting as they might be. This article offers some suggestions for their enlivenment by the inclusion of well-posed figures.

LOOKING DOWN ON SCARBOROUGH.

EVERY summer dozens of snapshots are brought home by enthusiastic holiday-makers, to be handed round the family circle and shown to friends as records of places visited. Then they are put into an album or drawer, and forgotten altogether in a few months. The reason is that possibly they do not "live," and that equally good or even better ones can be purchased from stationers' shops in the form of postcards. Hence the bore of seeing the same thing over again in miniature.

By a little forethought these views can be made personal affairs. Try getting your companions in the foreground of every picture. Get them to look at the view you wish to snap or to do something in keeping with the holiday spirit—writing letters, eading, kite-flying, or rock-climbing. Your "records" will then be converted into pictures, bringing back happy memories of pleasant events in pleasant

BESIDE THE HARBOUR AT BRIDLINGTON.

surroundings. It will not be a case of . . . "Let's see, was this Blackpool or Bridlington?" Every picture will be at once located, without titles, by the "incident."

The little girl in the bathing costume is looking at the harpist on a favourite part of Brid-

applies to the other pictures illustrating this article. A general view of the south side of Scarborough with the harbour far beneath has far more appeal by including members of my own family. And the actual task of photographing my friends in conjunction with the places is vastly more interesting than the mere recording of the places alone.

Open views, in particular, require foregrounds, in the absence of which they tend to be very dull indeed unless surmounted with cloud formations of exceptional interest. In front of such a view members of the family tend to be self-conscious intruders visibly acting as foreground, but in the case of the view from Beeston Hill I was lucky in finding a plausible reason for their presence.

Subjects such as these can sometimes be very profitable by entering them in the various "Summer Snapshot" contests which are now so popular. The ordinary view very rarely stands a chance of success, but the same picture infused with "human interest" has its possibilities as a potential prizewinner very greatly enlarged.

A HARPIST ON BRIDLINGTON BEACH.

lington beach. I wanted a picture of this part, with its sea wall upon which such delicious hot chocolate drinks were served after our morning swim. But somehow I did not want a postcardy record. Here we have it then, with the personal appeal as the chief subject in a view full of associations. The same

KITE FLYING ON BEESTON HILL, SHERINGHAM.

THE SAME—with a Difference

By DAPHNE BURTON.

"COMPARISONS are odious," say the copybooks. Nevertheless they are the photographer's salvation. Comparison of his own work with that of the masters shows him how far he has yet to go. Comparison of his present work with that of his past shows his progress. Comparison of different viewpoints and styles for the same subject shows the possibilities of his art.

I have just been looking through a set of child studies. They interested me so much that I thought others might like to see them too. They are illustrative of "that little difference that means so much."

Let us consider them individually for a few moments.

Fig. 1 is definitely a snapshot and rather a poor one at that. It is just the type of thing that appeals to adoring mothers who will instruct their offspring to "look at the camera, darling" as soon as the harassed photographer gets to work. The child is looking at the camera and the self-conscious hand held to the mouth is most unbecom- ing.

Fig. 2 is a distinct improvement. The child is looking

FIG. 1. Just a snapshot.

It is, in short, quite a charming little picture. With no pretensions to serious photography it is one of those delightful studies that are the joy of every photographer.

It should be the aim of every keen photographer to get pictures rather than snapshots whenever a suitable subject presents itself. Make a habit of noticing line whenever a suitable subject presents itself. Make a habit of noticing line even when no photograph is contemplated.

This training of the eye makes the mind quick to take decisions when subjects are to hand. With child photography posing is almost an impossibility. An instantaneous seizing of the desired attitude and expression is essential. Let the child be natural and move naturally. Be so sure of your instrument that a steady flow of easy chatter is no effort for you, and your little subject soon forgets the camera and the most natural results are obtainable.

The great secret of success is patience and speed. Patience to wait for the right moment; speed of action to seize the opportunity immediately it presents itself.

FIG. 2. A vast improvement on Fig. 1.

FIG. 3. The legs are better posed in this print, but the arm is inclined to look stiff.

at the ducks, but her legs are awkwardly drawn up, although her arms give a more attractive line. Fig. 3 shows a better line for the legs, but the arm is ugly, giving an impression of stiffness which is distinctly foreign to the natural charm of the subject.

A vast improvement on the other three is shown by Fig. 4. Here the left leg is slightly more extended and the body more relaxed, giving a feeling of ease. A triangular line runs easily from the left toe to the forehead, down to the right forefinger and back to the foot again. The whole attitude rests the eye. There is nothing to detract from the figure's grace and intentness on the ducks. Subject and object are really connected.

FIG. 4. A satisfactory pose, which is both natural and unaffected.

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Two Ideas in One Shot By S. E. L. M.

ALMOST every medium of expression has something to commend it over and above all other media. Literature, with its wealth of similes, metaphors and onomatopoeia, can be made more descriptive than any painting—which, when it does tackle any of these devices, is again somewhat more effective than music can be.

No cinematographer has yet discovered how fully expressive the film can be made; yet enough is known to satisfy us that it is superior in effect and versatility to any other medium. It has movement which can only be suggested in sculpture, painting and photography. It presents the actual picture in a fraction of the time taken by metal type to build up but an arbitrary description. It is relied upon as indisputable evidence in matters ranging from racing details to daylight robbery—the while our critics are being argumentative over the “meaning” of a statue or a symphony, and the printed word in one morning paper denies that which appears in another.

Amongst these less effective media, the cinema rears aloft its head. Let it further show its ability to carry two (or more) ideas within a single one of its basic shots.

Ideas.

By way of explanation, we may say that a film-inspired idea is but an impression created by the shot-content within the mind of an observer. Most directors realise this. They try to make every shot—or series of shots—convey an idea.

One such idea is that of military parade and bravo. And this has been put over so well, in recent ceremonial films, that many of us are still ennobled with stirring emotions. Now, Trivas, in his “*Niemandsland*,” also shows the military—not on parade, not as spectacle, but in the demoralising filth of the trenches. Both his shot and almost any shot from the other films are examples of inspiring one idea through a single shot, albeit the idea of one differs from that of the other.

Double Ideas.

Fritz Lang wanted to go one better. In a single shot, he wanted to suggest both the stirring splendour and all the compassionate horror that real warfare so freely produces. He wanted the shot of two ideas.

So he filmed the parade of soldiers; but he filmed it through the shattered leg of a maimed fighter—who was

placed sufficiently close to the camera to frame a perfect balance for the two ideas.

Yet another side of war is shown in the amateur “*Gaiety of Nations*,” by John Ahearn and G. H. Sewell. In this film (now some years old) we see the profiteers and their gleeful reactions to the ever-rising prices. Pabst, however, shows that the people of his “*Joyless Street*” could not afford to pay these prices for their bare necessities. It was left to Hugh Cuthbertson, in his “*Budget*” film, to bring these two ideas within the compass of a single shot.

Other Ideas.

So far, we have been concerned with combining only two ideas. And although we can conceivably add another to Lang’s shot without destroying its earlier effect, it is felt that further additions would become dangerously subtle.

We have, too, considered our double-purpose shots only in the light of ideas which are opposed one to the other.

Fortunately, there is ample scope for combining sympathetic ideas.

The Academy Cinema, in London, has recently shown a camping “short” in which two such sympathetic ideas are very cleverly conveyed in just one medium-shot. Here, three bathing beauties are playing medicine-ball on the sands. We see their movements and the passing ball only in crisp, long shadows; but the lower half only of one player is materially photographed in the foreground—to inspire the second idea of grace and elegance.

From this and other examples of the double-idea shot, it is obvious that here we have a device which is at once facile, interesting and expressive. It is a device well worthy of investigation, for in the three attributes alone mentioned lies the very quality with which all appealing films are endowed.

Maybe particular problems will require a little thought. But that is something which adds to all the pleasure of filmmaking.

HOOP-LA ON THE BEACH.

This new version of an old game is just the kind of subject that the cinematographer on holiday would welcome as a change from the more usual diversions of the beach.

ACTION SUBJECTS FOR THE AMATEUR CINEMATOGRAPHER

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Thursday, August 26th.

Armley and Wortley P.S. "Picture Lending from Members' Prints."
Hackney P.S. Outing. Abridge to Lambourne End.
Hampshire House P.S. "Sidelights of Camera Manufacture."
Liverpool A.P.A. Informal Meeting.
North Middlesex P.S. General Discussion.
Stretford C.C. Monthly Exhibition of General Architectural Subjects.

Friday, August 27th.

Folkestone C.C. "Portrait Photography." T. Baglia-White.

Saturday, August 28th.

Aston P.S. Outing to Aston Cantlow.
Bournemouth C.C. Afternoon Outing: Cruise to Wareham.
Bristol P.S. Stapleton Glen.
Hull P.S. Flamborough. J. Smith.
Ipswich and D.P.S. Proposed River Trip on the Orwell.
Leicester and Leicestershire P.S. Outing to Copt Oak and Ulverscroft.
Manchester A.P.S. "Marple." Dr. G. Jessel.
Partick C.C. Clyde Cruising Club, Bardowie. J. C. Baldon.
Sheffield P.S. Hardwick. J. H. Holmes.
Stockport P.S. Wilmslow. P. S. Wilkinson.
Walthamstow and D.P.S. Beginning of Annual Exhibition.
Wimbledon Ciné C. Programme of Films.
Woolwich P.S. Morden College. Mr. Vines.

Sunday, August 29th.

City of L. and Cripplegate P.S. Cobham, Kent. Mr. Philphot.
Hampshire House P.S. Chesham. C. B. Casson.
Ilford P.S. Epping Green and Upland. Mr. Roughton.
North-West London C.C. Outing to Oxford.
Singer C.C. "The Scott Country."
Worthing C.C. Outing to Graffham Common by Car.

Monday, August 30th.

Leeds C.C. Finishing the Exhibition Print.
Oldham Equitable P.S. Dufay Film Demonstration.
Southampton C.C. Monthly Print Competition Evening.

Tuesday, August 31st.

Blackpool and Fylde P.S. Monthly Meeting at H.Q.
Hackney P.S. Portraiture by Artificial Light.
Manchester A.P.S. "The After-Treatment of Negatives."

Wednesday, September 1st.

Blackpool and Fylde P.S. Over Wyre.
Solihull P.S. "The After-Treatment of Negatives."

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

FAIR PLAY FOR THE VERTICAL LINES.

SIR,—I wonder if the letter of Mr. D. Webster Robertson on the above subject will cause painters, draughtsmen and others to amend their ideas and methods in architectural drawing. Architects in particular, having no "artistic licence" to fall back upon, must adopt new methods of drawing elevations. It is evident that everybody is wrong except Mr. Robertson; or at least it is evident if we take his word for it.

I venture to assert (as the saying goes) that neither Mr. Robertson nor anyone else can decide from internal evidence in a photograph whether a rising front was used or not!

If that statement is wrong, it can be proved to be so; if it is right, all these diatribes against the rising front come to naught.

Mr. Robertson gave the example of a chimney-stack with parallel sides, 60 ft. high, and with its base 80 ft. from the lens, and said that the top would be 100 ft. from the lens. The 45th proposition of the first book of Euclid, and the accepted formulae for the mensuration of right-angled triangles, forbid me to dispute his calculation; but I do not accept his conclusion that if the lens gives 1 in. as the width of the base it should give $\frac{4}{5}$ ths of an inch as the width of the top.

Suppose there are two such chimneys laid on the ground base to base, in a straight line parallel to the picture plane. Each of the tops will then be 100 ft. from the lens. I should like Mr. Robertson to tell me how he would manipulate his camera to make the bases 1 in. high and the tops $\frac{4}{5}$ ths in. high. If he can tell me this I shall probably screw up all my rising fronts so that I cannot use them any more.—Yours, etc.,
W. L. F. WASTELL.

NEO-COCCIN RETOUCHING.

SIR,—In connection with your recent note about neo-coccin, may I pass on to others a useful tip for softening the hard edge which is sometimes left after its application to part of a negative.

Neo-coccin is soluble in water, so apply the dye a little deeper than is required, and place the negative for a few minutes in a dish of still water—not running. If it is inspected after two or three minutes it will be noticed that the dye has dissolved out slightly and there is now no hard edge. This leaves a far softer edge than can be obtained by any means with a brush.—Yours, etc.,
H. WARWICK NEVILL.

REVERSE SPOOLING.

SIR,—I have been using this year a camera (Super Sport Dolly) which uses ordinary $3\frac{1}{2} \times 2\frac{1}{4}$ film, and is fitted with a second winding spool, so that a half-finished roll can be removed. While this was intended to facilitate the use of plates, etc., I have found it of inestimable value in using Dufaycolor and hypersensitive films alternatively with ordinary stock.

The use of special films would be greatly encouraged if reverse spooling was a standard fitting, and I would like to suggest to British manufacturers, who have lately produced several good designs, that it would be a good idea to start the fashion before it comes over from Germany.—Yours, etc.,
M. K. KIDD.

SCRATCHED FILMS.

SIR,—I feel that I must write and report a further success for the now famous Baskett's reducer, to which you have been recently giving such prominence.

I have just developed a strip of film for a friend, and was most annoyed to find that something had gone wrong within my developing tank, resulting in several bad scratches running the whole length of the strip, on the back, not the emulsion side.

It seemed to be hopelessly ruined, and I was wondering how I should break the news to the unfortunate owner, when it occurred to me to try to lessen the damage with Baskett's.

I am delighted to be able to say that half an hour's vigorous application completely removed the scratches, and the negatives have yielded excellent enlargements quite free from blemish.

My friend will now never know the truth, and my prestige has been saved.

So once more Baskett's reducer steps into the breach, creating perfect negatives from hopeless ruin. My everlasting gratitude to its "inventor."—Yours, etc.,
L. G. GERMAN.

HYPERSENSITISING WITH MERCURY.

SIR,—The startling claims made for the mercury treatment of emulsions for temporary hypersensitisation appear to have given rise to widely divergent expressions of opinion in the photographic Press. You may therefore be interested in the following extract from a letter I have received from Messrs. Ilford Ltd. in reply to my specific enquiry for their opinion on the subject.

"In reply to your enquiry in regard to the hypersensitising with mercury, some work has been done on this which confirms the claims made that it is possible to double the speed of the emulsion by exposing the plates or films in closed vessels to mercury vapour. On removal from mercury vapour these plates or films gradually assume their original speed, the return to the original speed occupying three or four weeks. We would, however, prefer not to comment on the theory of this."

It would seem that the claims made for this treatment must have a very solid foundation to produce such a statement from so famous a firm of emulsion manufacturers as Messrs. Ilford Ltd.—Yours, etc.,
E. NEWTON SMITH.

FERRICYANIDE STAINS.

SIR,—I daresay that many of your readers from time to time make use of Farmer's reducer to remove unwanted backgrounds from prints, and that if so they may have suffered from the yellow stains this reducer sometimes leaves; as I did myself until I made a discovery.

I found that if the stained area was swabbed with ordinary tincture of iodine and the print immediately dipped in a hypo bath the ferricyanide stain was completely removed. Of course, tincture of iodine is itself a reducer, and should not be allowed to stray over the whole print, but only the already bleached areas.

I hope this tip may be of use, and would finally assure those who try it that the devastating stain of iodine vanishes at once in hypo.—Yours, etc.,
STEPHEN MOGRIDGE.

HELP WANTED.

KIND SIRs,—In England I am new and excuse the English, she is mix.

In the ship he make the little photograph I am much interest. I ask how I make the little photograph and he say a Dripper and a Watamother glass and they have expense.

In England I look and no Dripper and Watamother. The shop peoples say no Dripper. The peoples reading your book I think they tell me where I get a Dripper photograph and a Watamother glass please.—Yours, etc.,
ANTONIO COSIO.

FERRICYANIDE FOR REDUCING.

SIR,—This incident may amuse some of your readers.

I asked for some potassium ferricyanide. Being a chemist's which does the bulk of the trade in ladies' handbags, cosmetics, etc., the assistant stared at me in wonder for a few moments before vanishing behind the partition.

Reappearing with my package, his mind apparently on poison regulations, he asked: "What were you wanting this for, sir?"

With thoughts entirely photographic, I answered "Reducing," and looked at some cheap cameras nearby while he made out the bill.

"I suppose you know it is poison, sir?"

"Oh, yes," I replied, casually, and turned to see a look of astonishment spread over his face.

"Then—" and he paused. We looked at each other for perhaps half a minute, when the "penny dropped" and I realised what he was thinking.

Solemnly I remarked, "Reducing photographs, I should have said."

Sighs of relief escaped the waiting customers as they returned to life, and business went on again as usual.—Yours, etc.,
J. B. BROOMHEAD.

Exhibitions and Competitions CURRENT AND FUTURE.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, August 31. Rules on this page.

The Amateur Photographer Novices' Competition.—Special prizes of supplies of films. Latest date for entries, September 30. Particulars in this issue.

Wallace Heaton Competition.—Cash prizes every week.—Open to readers of *The Amateur Photographer*. Full particulars in advertisement page in this issue.

Nuro Competition.—Cash prizes every month. Special prizes for boys and girls under sixteen. Full particulars obtainable from any photographic dealer, or from Nuro Ltd., Biggleswade, Bedfordshire.

Isle of Man Sixth Annual Amateur Photographic Competition, £300 cash prizes. Open, until September 30. (P. A. Clague, Publicity Department, Isle of Man.)

XVIE Salon International de Photographie de Belgique.—Open, May-October. (M. Julien Lejeune, 70, Av. Van Becelaere, Boitsfort, Brussels.)

Eighth Chicago International Salon of Photography.—Open, July 15-September 19. (Alex. J. Krupy, Chicago Camera Club, 137, North Wabash Avenue, Chicago, Illinois, U.S.A.)

XXXIIE Salon International d'Art Photographique de Paris.—Open, October 2-17. (Le Secrétaire, Société Française de Photographie et de Cinématographie, 51, Rue de Clichy, Paris (9e).)

I International Exhibition of the Photo-Press and Literature (Jugoslavia).—Open, October. (Fotoklub Zagreb, Masarykova II, Zagreb, Jugoslavia.)

Royal Photographic Society of Great Britain, 82nd Annual Exhibition.—Open, September 11-October 9. (The Secretary, Royal Photographic Society, 35, Russell Square, W.C.1.)

46th Toronto Salon of Photography.—Open, August 27-September 11. (W. H. Hammond, 2, Gould Street, Toronto, Canada.)

3e Internationale Focus Fotosalon, Amsterdam,

Holland.—Open, September 11-26. (Focus, Ltd., Fotosalon, Bloemendaal, Holland.)

Second Western Ontario Salon of Photography.—Entries, August 25; open, September 13-18. (A. E. Adams, 923, Maitland Street, London, Canada.)

London Salon of Photography.—Entries, September 1; open, September 11-October 9. (The Honorary Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.)

First International Competition of Artistic Photographic Pictures, 1937.—Entries, September 1, 1937. ("Camera," Messrs. C. J. Bucher, Ltd. (Publishers), Zurichstrasse, 3/5, Lucerne, Switzerland.)

Fifth Annual Salon, Rockville Centre, N.Y.—Entries, September 1; open, September 11-18. (Dr. M. F. Lee, 74, N. Long Beach Road, Rockville Centre, N.Y.)

Anthracite Salon of Photography, Everhart Museum, Scranton, Penna, U.S.A.—Entries, September 7; open, September 18-October 4. (Salon Director, Everhart Museum, Scranton, Penna, U.S.A.)

The Victorian International Salon.—Entries, September 7; open, October 18-30. (C. Stuart Tompkins, The Junction, Camberwell, E.6, Victoria, Australia.)

International Photographic Exhibition, Budapest.—Entries, September 20; open, October. (Modern Magyar Fényképezők, VIII, Rákóczi-ut 19, Budapest.)

Windesham Camera Club.—Open, October 21-23. Last day for entries, October 2. (J. C. Hayward, Hallgrove, Bagshot, Surrey.)

Fourth Canadian International Salon of Photographic Art.—Entries, before September 10; open, October 23-November 15. (Exhibition Secretary, Canadian International Salon of Photographic Art, The National Gallery of Canada, Ottawa, Canada.)

Rotherham Photographic Society Forty-eighth Annual International Exhibition.—Entries, September 20; open, October 12-16 inclusive. (E. G. Alderman, Ruardean, Newton Street, Rotherham, Yorks.)

Sixth Irish Salon of Photography.—Entries, September 25; open, October 30-November 6. (The Hon. Secretary, 18, Morehampton Road, Dublin.)

"Irish Travel" Photographic Competition, 1937. Cash prizes.—Entries, September 30. (The General Manager (Photo Competition), Irish Tourist Association, 14, Upper O'Connell Street, Dublin, I.F.S.)

Cyclists' Touring Club (Metropolitan D.A.) Second Annual Photographic Competition.—Entries, September 30; open, October 28-30. (G. H. Craddock, 9, Lady Margaret Road, Kentish Town, N.W.5.)

Lincoln C.C. Eleventh Annual Open Exhibition.—Entries, October 1; open, October 29-November 26. (Miss E. Redfern, 8, Cecil Street, Lincoln.)

International Salon Oval Table Society, Inc.—Entries, October 23; open, November 16-30. (Oval Table Society, Inc., 10, W. 23rd Street, New York.)

1st Rhode Island National Salon of Photography.—Entries, November 1; open, November 15-30. (J. Clement Grimes, 103, Westminster Street, Providence, Rhode Island, U.S.A.)

International Photographic Exhibition in Debrecen (Hungary).—Entries, November 20; open, January. (Aszmann Ferenc, Ferenc József ut 27, Debrecen, Hungary.)

XIe International Fotosalon "Iris".—Open, January, 1938; last day for prints and entry forms, November 30, 1937. (F. Geeraerts, Braderodestr. 22, Antwerp, Belgium.)

Second Indian International Salon of Photographic Art.—Entries, January 15; open, March, 1938. (N. B. Cooper, Hon. Sec., Camera Pictorialists of Bombay, 53, Nicol Road, Ballard Estate, Bombay, India.)

Leicester and Leicestershire Photographic Society's International Exhibition.—February 21-March 12, 1938. Last day for entries, January 29, 1938. (H. Foscutt, 19, Doncaster Road, Leicester.)

"The A.P." Monthly Competitions PRIZES AND RULES.

(I) For Advanced Workers.

This class is open to all amateur photographers. First Prize.—One guinea in cash or "A.P." silver plaque (optional).

Second Prize.—Half a guinea in cash or "A.P." bronze plaque (optional).

Third Prize.—Five shillings in cash. A special prize of five shillings in cash for the best mounted picture.

CERTIFICATES OF MERIT. In addition to the general rules (see below), the following conditions apply:—

(1) All prints must be accompanied by a stamped addressed envelope or wrapper if they are to be returned. Prints receiving an award will be retained.

(2) Prints must be mounted, but not framed.

(3) Returnable prints in the Advanced Section will be sent back with a typed criticism, and classified according to merit.

(4) Prints may be of any size and by any process, and must be the competitor's own work throughout.

(5) The award of a prize or certificate in the Advanced Workers' Competition or any other competition or exhibition will not debar the competitor from entering again on future occasions and winning further prizes.

(II) For Intermediate Workers.

This class is to encourage those readers who have passed the "beginner" stage and may have won an award in the Beginners' Competition, but have not progressed sufficiently to enter in the Advanced Competition.

First Prize.—Half a guinea in cash. Second Prize.—Five shillings in cash.

CERTIFICATES OF MERIT. In addition to the general rules (see below), the following conditions apply:—

ADVANCED WORKERS' SECTION.

First Prize.—"Ducks," by Ernest Wm. Chadwick, 12, Linden Avenue, Dewsbury Road, Leeds, 11.

Second Prize.—"Near Broadcasting House," by R. M. Roberts, Cothercott, Evelyn Drive, Pinner, Middlesex.

Third Prize.—"A Corner in Sunshine," by C. Peirpoint, 42, Anson Road, Cricklewood, N.W.2.

Mounting Prize.—"Highland Sheep," by A. S. A. Wooster, Sunny Brae, Booker Lane, High Wycombe, Bucks.

Certificates of Merit.—"Menace," by Donald G. Sheldon, 526, Inglemire Lane, Hull; "A Corner in Lavenham," by H. E. Haase, 10, Gresham Road, E.C.2; "At Low Tide," by Wilfred Turner, Southend, Westminster Road, Hale, Cheshire.

The prints not receiving awards have been grouped, those in the first group receiving Honourable Mention. The others have been marked Class 1 and Class 2 respectively.

(1) No print must be larger than 10x8 in., and can be by contact or enlargement by any process, and may be mounted.

(2) The whole of the work (exposure, development, printing, etc.) must be carried out by the competitor.

(3) Prints entered in the Intermediate Section will be criticised and returned if accompanied by stamped addressed envelope or wrapper. Prints receiving an award will be retained.

(4) The award of a prize or certificate in the Intermediate Competition debars the competitor from entering this competition again, but he is then eligible for the Advanced Workers' Section.

(III) For Beginners.

This class is open to those who have never won an award in any photographic competition or exhibition.

First Prize.—Half a guinea in cash. Second Prize.—Five shillings in cash.

CERTIFICATES OF MERIT. In addition to the general rules (see below), the following conditions apply:—

(1) No print must be larger than 6x4 in. Contact prints or small enlargements up to this size are eligible, but must be unmounted.

(2) The exposure must have been made by the competitor, but developing and printing may be the work of others.

(3) No prints can be criticised or returned.

(4) The award of a prize or certificate in the Beginners' Competition debars the competitor from entering this section again.

General Rules.

(1) Any number of prints may be entered, but each print must have on the back the appropriate coupon (see advertisement pages) the date of which must be

within five weeks of the closing date of the competition. Overseas readers may use the most recent coupons to hand.

(2) Each print must have on the back the name and address of the competitor, and the title.

(3) All entries must be addressed to The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the package must be marked on the outside "Beginners," "Intermediate," or "Advanced," as the case may be.

(4) No packages will be received on which there are postage charges to be paid.

(5) No communication on other matters should be enclosed with competition prints. No correspondence in connection with the competitions can be undertaken.

(6) The entry of a print will be regarded as a declaration that it is eligible under the rules, and that the competitor agrees thereto.

(7) No responsibility is taken for the safety of prints, and the Editor's decision on all points connected with the competitions is final.

(8) The publishers of *The Amateur Photographer* shall have the right to reproduce, without payment, any print entered, or to allow its reproduction in any other paper quoting from *The Amateur Photographer*.

(9) The closing date of each competition is the last weekday of the month. Prints arriving late will be entered for the next month's competition.

(10) The cash prizes awarded in these competitions are dispatched on the fifteenth of the month following the announcement of the awards.

The closing date for the August competition is Tuesday, August 31st, and for the September competition, Thursday, September 30th.

"Relaxation," by S. C. Banerji, New Dakbunglow Road, Patna; "Siesta," by Dr. K. J. Talbot, Western Ophthalmic Hospital, Marylebone Road, N.W.1; "The Sentinels—a Floodlight Fantasy," by G. I. Goddard, 77, Croxeted Road, Dulwich, S.E.21; "Mother and Child," by Cyril S. Woolley, 27, Burford Road, Bickley, Kent.

BEGINNERS' SECTION.

First Prize.—"The Approaching Storm," by N. E. Wilson, 80, Northfield, Birmingham.

Second Prize.—"The Argument," by T. B. Somerville, 11, Entwistle Avenue, Davyhulme, Manchester.

Certificates of Merit.—"In Swanmore Park, Arundel," by C. T. Hitchcock, 109, Holdenhurst Road, Bournemouth, Hants; "Outdoor Portrait," by Mrs. Doris Mills, High Street, Lane End, Bucks; "The Bernese Oberland," by A. G. Hagger, 7, Claremont Road, West Kirby, Ches.; "Do I see a Sailor," by Reginald Lionel, 50, Garthorne Road, S.E.23.

AWARDS FOR JULY.

Those awarded Honourable Mention are as follows: J. C. Gilchrist (Pitlochry); (2) Alan Rowley (London, N.12); Miss Edna Marshall (London, S.E.23); A. L. Syed (India); Syd. C. Taylor (Bishop Auckland); C. Pierpoint (London, N.W.2); A. G. Dell (W. Norwood); (2) Mrs. K. M. Parsons (Reading); A. H. Roche (Ealing); Miss S. D. Kooka (India); P. Walshaw (Nelson, Lancs); (2) J. H. Clark (London, S.E.5); G. G. Jagannathadas (Madras); C. S. Webb (Welling, Kent); E. Wm. Chadwick (Leeds); S. E. Briggs (Ilkeston).

INTERMEDIATE SECTION.

First Prize.—"Power," by W. J. G. France, Ben Rhydding, Woodcroft Avenue, Stanmore, Middlesex.

Second Prize.—"The Mooring Rope," by George Crick, 267, Breck Road, Liverpool, 5.

Certificates of Merit.—"Glass," by Dr. M. N. Dalal, 8, Bhoirob Mukerjee Lane, P.O. Belgachia, Calcutta;

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

A new model of the Tempiphot exposure meter, known as Model T30/100, has recently been introduced. Even without the amplifying element, which can be plugged into it when the light is very weak, the Tempiphot is decidedly sensitive, for it will give a distinct reading in a light so poor that an exposure

of 1 sec. is required when using film of speed 29 degrees Scheiner in conjunction with a lens aperture of $f/2$. When the extra element is attached, the sensitivity is increased four times. The meter is particularly easy to read, since the pointer moves against a scale of exposure times. This scale revolves, and is set at the right position by adjusting the external calculator

first to the speed of the film in use (a semi-permanent adjustment this, requiring a definite effort to reset), and secondly to the stop to be employed. Two ranges of sensitivity are provided, in the higher of which the whole face of the cell is exposed to light behind a window of plain glass. On the less sensitive range, for bright light, most of the cell is covered, and the part exposed is shielded by a tube from light not reaching the meter from the actual direction of the subject. A check of accuracy showed that the meter indicated, under several different conditions, exposures that would give well-exposed negatives, and we should in consequence feel every confidence in adopting the exposure times it indicates. The Tempiphot is small, measuring $3\frac{1}{2} \times 2\frac{3}{8}$ in. and is only a shade over three-quarters of an inch thick. At the price of £4 5s., including purse, it may be obtained through any dealer, or from the importers, Messrs. R. F. Hunter, 51, Gray's Inn Road, W.C.1. The amplifier costs £1 17s. 6d. extra.

The Eleventh International Salon of Photography organised by the "Fotografische Kring Iris" will be held in Antwerp in January, 1938. The last day for receiving prints is the 30th November, 1937. The entry forms, which contain full instructions regarding fees and conditions of entry, are now ready for distribution, and we have a limited number at these offices, or readers may apply direct to Mr. F. Geeraerts, Brederodestr. 22, Antwerp, Belgium.

Messrs. Agfa Photo Ltd. have just sent us the latest information in connection with their new series of roll and pack films. We reproduce this information, in abbreviated form, for the use of our readers.

Isochrom. Now known as Isochrom Feinkorn. Speed unchanged, grain finer. Development time reduced by 30 per cent.

Isochrom F. Now known as Isochrom Feinkorn. Speed increased 60 per cent, grain slightly improved, development time reduced 25 per cent.

Isopan. Now known as Isopan Feinkorn. Speed unchanged, grain very much finer, development time reduced 30 per cent.

Isopan I.S.S. 19/10 DIN. Now known as Isopan I.S.S. 21/10 DIN. Speed increased 60 per cent, grain improved, development time unchanged.

Similar information in connection with the miniature (35-mm.) film will be found in "Miniature Camera Gossip" on page 214 of this issue.

One of our readers Mr. F. E. Williams, of East Street, Ipswich, Queensland, Australia, who is a keen amateur photographer of about fifteen years' standing, wishes to correspond with English amateur photographers of either sex, age about 27, who, like himself, are users of the Rolleicord camera.

Colour film for the 9.5-mm. cinematographer is now offered by Messrs. Dufay-Chromex Ltd. This material, which is obtainable in chargers of the normal type (but not in "H" type chargers), costs 10s. 6d., including processing, for a 30-ft. length. Like the latest 16-mm. film, the new material has a reseau pattern of about 1,200 elements per linear inch. No filter is required when taking, nor, of course, when projecting. The speed of the film is the same as that of Dufaycolor film of other varieties. We are very sure that 9.5-mm. cine workers will extend an eager welcome to the new film, which is obtainable from any dealer. For any further information concerning it application should be made to Messrs. Dufay-Chromex Ltd., 14-16, Cockspur Street, S.W.1.

We are informed by the Photographic section of the Dartmouth Literary and Debating Society that there has been a change in the Secretaryship of this society. The Hon. Secretary and Treasurer now is Mr. F. C. Gould, Kia-Yam, Lower Fairview, Dartmouth.

The latest winner in the Wallace Heaton "Sunbathing Studies" Competition is Mr. H. S. Atkinson, 1, Knaresboro Avenue, Marton, Blackpool, to whom the weekly award of 21s. has been made for his print entitled "Sunbathing à la Carte." Full particulars regarding these competitions for readers of "The A.P." are published regularly in our advertisement pages.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. The series from No. 1 to 61 included all standard chemical and optical formulæ and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulæ issued by the leading manufacturers of plates, films and papers.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5 x 3, supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is $5\frac{1}{2} \times 3\frac{1}{2} \times 3$ and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

89. Makers' Formulæ: Developers for Barnet Papers—(2)

Normal M.Q. for Verona Warm-Tone Papers.

Metol	15 grs. (1.55 grm.)
Sodium sulphite (anhydrous) ..	210 grs. (22 grm.)
Hydroquinone	60 grs. (6.25 grm.)
Sodium carbonate (anhydrous) ..	155 grs. (16 grm.)
Water to	20 oz. (1,000 c.c.)

If crystallised sulphite and carbonate are used, take 420 grs. (44 grm.) of each.

For warm-black tones on Verona paper, dilute each 2 oz. (100 c.c.) of the above developer with 1 oz. (50 c.c.) of water, and

add 145 minims (15 c.c.) of 10 per cent potassium bromide solution. Develop at 65 degrees Fahr., at which temperature development should be complete in 3 minutes. The exposure should be kept full.

For Verona de Luxe paper, dilute each 2 oz. (100 c.c.) with 2 oz. (100 c.c.) of water, and add 75 minims (7.5 c.c.) of 10 per cent potassium bromide solution. Use at 65 degrees Fahr., at which temperature development should be complete in 2 minutes. A pleasing range of warm-black tones may be obtained by varying the amount of potassium bromide solution added from 35 to 150 minims (3.5 to 15 c.c.).

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a *separate* stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Degraded Tones with Filter.

Is there a tendency for a yellow filter to degrade the tones when using panchromatic film? I can always recognise a negative for which a filter was used; the image seems to lack "snap" and the print seems flat and degraded as compared with one taken without a filter. F. J. S. (London.)

Unless you are so accustomed to completely opaque skies that a negative showing sky-tone seems to you lacking in "snap," we cannot understand how a yellow filter, as such, could be said to degrade the tones of a negative. Some it will lighten and some it will darken, according to their colour, but it should not in any way impair delicacy of gradation or reduce contrast. If it is dirty, scratched, or has lost its polish it may scatter light a little, and so cause a small amount of general fog that would bring about something of the result you describe. Or it might catch the light by projecting farther forward than the lens, or by having a bright patch on the mount, and so cause reflections leading to a similar result. But on none of these suppositions would it be the yellowness that caused the degradation of tone; it would be imperfections in the glass or the mount.

If you could send us a comparison pair of negatives, taken on the same film, of the same subject, with and without the filter, and developed together, we might be able to make some more specific suggestions as to the cause of your trouble.

Copyright.

I have taken some photographs of motor racing. Can these be published without the drivers' permission, or does the copyright belong to them? C. W. (Croydon.)

If you have taken photographs of motor racing we know of no reason why you should not publish the results, as the copyright in the photographs belongs to you. Except for a few special cases, the copyright of any photograph is

vested in the photographer, who may do what he likes with them so long as he causes no damage, commits no libel, and holds nobody up to ridicule or opprobrium by doing so.

Entries to Foreign Exhibitions.

What is the most satisfactory way of sending the necessary entrance fee and return postage when dispatching entries to foreign exhibitions? And how can I determine the amount of return postage required? A. H. R. (Ealing.)

Money can be sent abroad by International Money Order, obtainable at any Post office. The Orders are, of course, made out in sterling. Alternatively, you can simply send a cheque, which you can make out in any currency you like; your bank will debit you with the equivalent in sterling when they pay the cheque. For postage, we suggest you reckon an amount 50 per cent greater than the postage you have to pay when you dispatch your prints. This may in some cases be more than is strictly necessary, but the excess will in any case be small, and can fairly be regarded as reasonable payment for the repacking of your pictures.

Proxar or Tessar?

In a recent issue a camera with a Zeiss Tessar lens was advertised, but in another part of the advertisement was the note "Proxar lens 20/- extra." I am willing to pay the extra for a better lens, but I should like your advice as to the relative merits of the two.

C. E. S. (Newcastle-on-Tyne.)

The Proxar lens to which you refer is not an alternative lens to the Tessar, but is a small supplementary lens which you slip over the Tessar when you wish to focus on objects very close to the camera. If you buy the camera in which you are interested you will therefore obtain it with a Tessar lens, and if you are likely to find a use for it in photographing very near objects, you will buy the Proxar as a separate accessory.

American Films.

Can you tell me, for use with your Monthly Exposure Table, the speed-class into which I ought to put the following Agfa films: Super Plenachrome, Fine-grain Plenachrome, and Superpan? H. G. W. (Canada.)

The films about which you enquire are made on your side of the Atlantic, and we have no reliable data about them here. But so far as we know, the Super-Plenachrome is much the same as the Isochrom film sold over here. The Fine-grain Plenachrome corresponds with Isochrom F., and the Superpan to the Isopan Super-Special (I.S.S.). If you reckon your films as equivalent in speed to these you will at least not be far out, and can, if necessary, revise a little your estimate of speed when you see your first batch of negatives.

Illumination.

I find difficulty in getting even illumination with my condenser enlarger, in which I am using a 100-watt pearl bulb. How could I make this right? R. J. (Chorley.)

Your trouble with the condenser enlarger suggests that the lamp is wrongly adjusted, and should be put either nearer to the condenser or farther from it. You will probably find it easier to get even illumination if you use an opal instead of a pearl bulb. If attention to these points leaves you still in difficulty, we suggest that you send full details of your trouble to the makers of the enlarger, who are naturally in a very much better position than ourselves to give you the necessary instructions for handling it.

Clear-Spot Focussing.

Can you give me any further details of aerial focussing, as mentioned in a recent issue of "The A.P."? I have a $3\frac{1}{2} \times 2\frac{1}{2}$ reflex camera, and find the grain of the ground glass makes dead-accurate focussing rather difficult, and hence would like to try this method. C. E. B. (Shrewsbury.)

The "clear-spot" focussing method requires a special magnifying eyepiece, and is not suitable for use with a reflex camera because when using the magnifier the eye has to be brought much closer to the screen than the hood of such a camera as yours will permit. Focussing screens with a really fine-grain surface are now obtainable, and we think your trouble will be solved if you use one of these in conjunction with focussing magnifiers in the hood of the camera.

Exposure and Size.

I have a quarter-plate camera for which I am having made an adapter for $3\frac{1}{2} \times 2\frac{1}{2}$ roll films. As the area of the roll film will be just half that which the lens is designed to cover effectively, do I halve my exposures when using the smaller film. Or do I double them? H. A. C. (Fishguard.)

Neither. The fact that your film negatives are smaller in size makes no difference whatever to exposure, which is governed, as always, by the actinic value of the light, the stop, and the speed of the emulsion. If you are still unconvinced, ask yourself how the middle part of the film can possibly be affected by the fact that the outer part of the picture is now to be received on metal instead of on the margins of a quarter-plate film.

HURRY! HURRY!! HURRAH!!!

All roads lead to "202" when "202" offers such a selection of second-hand accessories as those shown below. **DO NOT DELAY**, lest you be beaten to the article you require by some more zealous amateur; in many cases we have more than one specimen of the articles mentioned, but we cannot hope to hold them long. **BUY NOW!** In very nearly every case the accessories are in new condition, and, in any case, your money will be refunded if you are not satisfied. These chances may not occur again for some time to come, so take our advice and **DO NOT DELAY** but **BUY NOW!**

NAME.....

ADDRESS.....

A.P.

PLEASE MENTION "THE AMATEUR PHOTOGRAPHER" WHEN CORRESPONDING WITH ADVERTISERS.

The London Salon of Photography 1937.

SENDING-IN DAY, Wednesday, September 1st.

THE TWENTY-EIGHTH EXHIBITION promoted by the Members of the London Salon of Photography will be held at the Galleries of the Royal Society of Painters in Water Colours, 5a, Pall Mall East, London, S.W.1, from SATURDAY, 11th September, to 9th October, 1937.

CONDITIONS OF ENTRY.

(Please read carefully.)

1. Pictures must not be framed; but may be mounted or unmounted. Each picture must bear on the back clearly written (a) name of artist; (b) number and title of picture, corresponding to particulars on the Entry Form.
2. When mounts are used they should conform to the following sizes— 25×20 , 20×16 , or 15×12 ; but no mount to exceed 25×20 ; and it is suggested that white or light-toned mounts be employed. Prints may be of any shape or size, provided they do not exceed the limits of the mounts as given above.
3. All packages of exhibits from abroad must be clearly marked on the outside: "PHOTOGRAPHS FOR EXHIBITION ONLY—NO COMMERCIAL VALUE—TO BE RETURNED TO SENDER." *No prices to be marked on the prints.*
4. Pictures sent unmounted will be suitably mounted by the Salon Committee, and all accepted pictures will be shown under glass.
5. Pictures must be sent by post or parcels post, packed flat and properly protected with stiff cardboard and adequate wrappings, addressed to: THE HON. SECRETARY, THE LONDON SALON OF PHOTOGRAPHY, 5A, PALL MALL EAST, LONDON, S.W.1.
6. All pictures for the exhibition must arrive at the above address *on or before* Wednesday, September 1st. Entries may be delivered by hand at the Gallery on that date only.
7. The Entry Form for pictures from abroad must be sent SEPARATELY by post, together with entry and packing fee of 5s. (this fee covers any number of pictures from one exhibitor). Exhibitors residing in the British Isles may enclose Entry Form and fees with their pictures.
8. Pictures sent by post will be repacked in the original wrappings and returned, carriage paid, after the close of the exhibition.
9. As applications are made from time to time to The London Salon of Photography for permission to reproduce pictures from the walls of the Gallery, exhibitors are asked to signify, in the space provided on the Entry Form, whether they have objection to such permission being given. The copyright in all cases remains the property of the authors of the prints.
10. The Committee assure intending exhibitors that the greatest care will be taken of all work submitted, but they do not accept any responsibility for loss or damage, either during transit or at the Gallery.

If pictures are sold a Commission of 15% is payable to the Salon.

The submission of pictures will be understood to imply acceptance of the above conditions.

Notification of acceptance of pictures will be sent out as soon as possible.

A Catalogue will be sent to each exhibitor.

Entry Forms and further particulars from the Hon. Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1

"THE A.P."

Special Competition for Novices

THIS competition is specially for Novices, that is to say, those amateur photographers who have never won an award of any description in a photographic competition, and preferably those who are only just starting photography.

The prizes will be awarded for the best snapshots of subjects that the beginner usually attempts. These include snapshots of the family, groups or single figures taken at home or on holiday, either indoors or outdoors, and landscape and beach scenes, etc., with figures. The arrangement of the subject and the pose of the figure or groups is a matter left entirely to the discretion of the competitor.

The entries will be restricted to contact prints and enlargements of standard "Enprint" size, which do not exceed $4\frac{1}{2} \times 3\frac{1}{2}$ in., even if made from the whole negative. These may be mounted if preferred, and the smallness of any print will not affect its careful consideration in this competition. The rules are very simple, but should be read carefully.

THE PRIZES.

The prizes in this competition will consist of supplies of roll film or plates (for those winners who happen to use a plate camera), as follows:—

The First Prize will be TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.

The Second Prize will be TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.

The Third Prize will be ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.

Twelve Prizes of ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

RULES.

Each print must have affixed firmly to the back a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor. The latest date for receiving entries is September 30th.

The copyright of all prints entered remains the property of the authors of the photographs, but the right is reserved by "The A.P." to reproduce the winning prints and any others that may be worthy of mention. The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed to: The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices' Competition."

ANY DAY — EVERY DAY PERFECT PICTURES WITH **Rolleicord** MODEL II

Rolleicord is not just a summer snapshot camera—its optical equipment makes it perfect for good all-the-year-round photography. Ask the man who owns a Rolleicord—he will soon tell you what wonderful value it really is. It's so simple to use—it shows you what to take—you see your picture full size and right way up on the ground-glass screen—and what you see you get. It is versatile too—besides taking 12 pictures on standard $3\frac{1}{4} \times 2\frac{1}{4}$ roll film, it can be adapted for plates or 35-mm. miniature film. Rolleicord takes all Rolleiflex accessories except only the angle mirror. With f/3.5 Zeiss Triotar lens and Compur shutter speeded to 1/300th sec., T. & B.—it costs only £16:10:0; or with f/4.5 Zeiss Triotar lens—£14:10:0.

There is also the new model Ia Rolleicord—a camera of amazing value. With f/4.5 Zeiss Triotar lens—£12:10:0.

ENSIGN

DAYLIGHT ENLARGERS for miniatures

These "Big Print Makers" are no more difficult to handle than an ordinary printing frame, and the results are incomparably more attractive, particularly from the smaller sizes. There is no focussing. Just put the negative at one end and the bromide paper at the other. Solidly made of seasoned wood, leatherette covered. Holders for negative and bromide paper. Selected achromatic lens and metal plunger shutter.

For Postcard Enlargements from:—

$2\frac{1}{2} \times 1\frac{1}{8}$ in. (V.P.)..... 15s. 0d.
Half $2\frac{1}{2} \times 3\frac{1}{2}$ in. (16 on size 20) 15s. 0d.
 $2\frac{1}{2} \times 3\frac{1}{2}$ in. (or $3\frac{1}{2}$ square enlargement from $2\frac{1}{2}$ square)..... 17s. 6d.

For Half-plate Enlargements from:—

$2\frac{1}{2} \times 3\frac{1}{2}$ in. (or $4\frac{1}{4}$ square enlargement from $2\frac{1}{2}$ square)..... 27s. 6d.

An optical "D.V." Clip-on Finder for All Cameras

ENSIGN CLIP-ON

For $2\frac{1}{2} \times 3\frac{1}{2}$ or TWO-ON $2\frac{1}{2} \times 1\frac{1}{8}$ size pictures.

Can be instantly attached to all types of folding cameras by means of a spring clip. It only measures $1\frac{1}{4} \times \frac{1}{2} \times \frac{3}{4}$ in., and can be slipped into the waist-coat pocket when not in use. The detachable cover is provided with two mask sizes; the larger size, $2\frac{1}{2} \times 3\frac{1}{2}$ in., at one end, the smaller size, for $2\frac{1}{2} \times 1\frac{1}{8}$ in., at the other. The change from one to the other is effected simply by gripping the cover at both ends, lifting off and reversing.

Price 6/6

ENSIGN, Limited, HIGH HOLBORN, LONDON, W.C.1

NEW MODELS! Reduced Prices!

MODEL G. 3

PAILLARD-Bolex PROJECTORS

Increased demand for Paillard-Bolex projectors makes it possible not only to reduce prices, but to introduce a number of new "G" models covering all sub-standard projector needs. Whatever your requirements, they can now be met by a high-power projector giving the tremendous screen luminosity and pin-sharp definition for which Paillard projectors are famous.

There is also the new model D.A.37 with redesigned mechanism equivalent to a three-bladed shutter, giving perfectly flickerless projection from both 9.5-mm. and 16-mm. films, without any need to race machine. Now's your chance to own a Paillard-Bolex projector. Better screen illumination! Better screen quality! Better value!

MODEL G.3 for 8, 9.5 and 16 mm. films. Screen performance absolutely flickerless. Immense screen illumination with pin-sharp definition over whole picture area. Silent running and minimum film wear. All enclosed 100 per cent gear driven mechanism. All the latest cine refinements, including: still pictures, instantaneous reverse, motor rewind, interchangeable lamps, 500 watt or 250 watt (the latter costing only 21/-). Change from one film size to another only takes a few seconds. Projector, with accessories, fitted 2-in. lens and 500-watt lamp, price, including resistance £52 10 0

MODEL G.916, the same as above, but for projecting 9.5 and 16 mm. films. With resistance £45 0 0

MODEL G.816, the same as above, but for projecting 8 and 16 mm. films. With resistance £45 0 0

MODEL G.16, the same as above, but for projecting 16-mm. films only. With resistance £39 0 0

CINEX LIMITED
70 HIGH HOLBORN, LONDON, W.C.1

YOU DON'T KNOW

how fascinating amateur cinematography can be, simply because you've never troubled to find out anything about it, or, perhaps, because you are labouring, as are so many others, under the misapprehension that this enthralling branch of photography is solely a rich man's pastime. Why not let us show you just how cheaply you can set up a first-class home cinema? We should be delighted to give any assistance within our power, and our service is quite unparalleled. WRITE TO-DAY for a part exchange offer for your present outfit; any balance on the apparatus of your choice could be spread over a period—anything up to two years—so there is really no valid reason for your denying yourself the pleasure of home cinematography.

BELL & HOWELL

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS:—

12 words or less.....2/6
2½d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 230, Deansgate, Manchester, 3; 26a, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer," when both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged; over £10 and under £50, 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to ILIFFE & SONS LTD., and crossed

& Co.

Notes being untraceable if lost in transit should not be sent as remittances.

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

RANGE-FINDER VAUXHALL MINICAM

TAKES 12 OR 16 PICTURES ON STANDARD 3½ x 2½ FILM

FINEST MOROCCO LEATHER COVERING

ALL METAL BODY

REAL LEATHER BELLOWS

THE CAMERA COMPANY are proud to announce this exclusive new Vauxhall Super-Minicam with Coupled Range-finder.

Here is a coupled range-finder miniature, fitted with the finest quality f/2.9 anastigmat lens in delayed-action Compur shutter, selling at a price which YOU can afford. Actually its nearest competitor is approximately 40 per cent higher priced—BUT the Vauxhall has numerous advantages not to be found in other cameras of this type.

For instance, it takes two sizes of picture according to choice—either twelve 2½ in. square or 16 2½ x 1½ in. Another exclusive feature is the special radial focussing lever which automatically springs back into the infinity position when the camera is closed, thus preventing any possible damage to the camera or focussing mechanism.

PRICE £11 15s. ONLY

Yours for 20/7 down and eleven similar monthly payments.

★ SEND FOR LEAFLET ★

STANDARD MINICAM

(without Coupled Range-finder)

This popular model is of similar construction and specification as the above Super-Minicam, with the exception that it has a direct-vision optical view-finder at the side in place of the coupled range-finder. Also micrometer lens focussing is fitted instead of the radial focussing lever.

PRICES.

2½ square or V.P., f/2.9 anastigmat, Compur shutter **£6 : 19 : 6**
(Or under our SELF-FINANCED Hire Purchase Terms of 12 monthly payments of 12/3.)

Ditto, with Prontor II shutter **£5 : 19 : 6**

(Or under our SELF-FINANCED Hire Purchase Terms of 12 monthly payments of 10/6.)

How happy could I be with either!

Very happy indeed; but one may be much more suited to your needs than the other! Place your business with Pelling & Cross—we're almost human—and avoid that sinking feeling that comes after buying the wrong article. You can't have had beers you know, but some are better than others, and the same remarks apply to cameras.

SUPER SPORT DOLLY

Maximum possible value for the "one-camera" man. Detachable large aperture lens in Compur shutter. For films, plates and film packs. Focusing screen and 3 slides. Meyer Trioplan f/2.9 £10 10 0
Schneider Xenar f/2.8 £12 17 6
Zeiss Tessar f/2.8 £15 7 6

IKOFLEX II

Recommended to the man who is interested in life studies, especially of children. Easy to operate, depth-of-focus scale, brilliant image.

Novar f/4.5, Kilo shutter £9 0 0
Triotar f/3.5, Compur 00 £15 12 6
Tessar f/3.5, Compur 00R £20 10 0

Part Exchange. Deferred Terms 5 per cent.

WALL'S DICTIONARY of PHOTOGRAPHY

and Reference Book for the Amateur and Professional Photographer

Fourteenth Edition—Revised

Edited and largely re-written by
F. J. MORTIMER, Hon. F.R.P.S.

A complete reference work for the practical photographic worker. It provides useful information in dictionary form on every phase of photography—technical, pictorial, scientific and general, and is in itself an explanatory index to all terms, formulae, etc. All the latest photographic principles are incorporated in the present edition, which includes up-to-date information on all recent developments.

A New Book which will help you to get the best results with your camera

Brighter Photography

by **DAVID CHARLES,**
 F.R.P.S.

This handy book reveals in a clear, attractive way the secrets of successful photography. Though primarily intended for the novice, it is invaluable to every keen camera user.

The carefully arranged chapters cover the whole field from the choosing of a camera to developing and printing the finished picture. Details of the various photographic materials on the market are given, and there are important sections dealing with Focussing, Aiming the Camera, Photographic Groups, Lighting and Exposing.

In addition there are over one hundred and sixty illustrations, each numbered and each conveying a really useful hint. By simple cross references these illustrations provide a series of clear, concise lessons in the art of making better pictures.

THE CAMERA THAT THINKS FOR YOU

ROBOT

The wonderful new "Robot" camera, in its mechanical perfection, allows you to forget the mechanics of photography.

The "Robot" embodies every device that camera-craft can contrive to free your mind for the picture—and the picture alone. An action—a fleeting gesture and the "Robot," with its quick-fire sequence "shooting," has it held fast for all time... a "Picture that lives." Nothing like the "Robot" has ever been available before. Free demonstrations with pleasure.

BUY YOUR "ROBOT" ON OUR FAMOUS EASY PAYMENTS

With Zeiss Tessar f/2.8 3 cm.£29 10 0

26/6 A MONTH for 24 months

23/9 A MONTH for 24 months

With Meyer Primotar f/3.5 3 cm.£23 10 0

21/2 A MONTH for 24 months

GOOD ALLOWANCE ON YOUR PRESENT CAMERA

Some Advantages the "ROBOT" brings :

- Shoots sequence pictures with machine-gun speed.
- Film winds itself automatically.
- No double or overlapping exposures possible.
- Takes up to 50 exposures on standard 35-mm. film.
- Camera opens in daylight for changing from "pan" to colour film at any moment.
- Incorporates filter suitable for "pan" or "ortho" films.
- Three view-finders in one, including "right-angle" for "candid" work.
- Interchangeable lenses.

SPECIAL DEVELOPING AND PRINTING NEWS FOR MINIATURISTS!

STRIP PRINTS FROM LEICA AND OTHER 36-exp. 35-mm. NEGATIVES

Wallace Heaton were first as usual with this new method of dealing with miniature films. We make complete strip prints (36 exposures) for 3/6. These may be had on velvet or glossy paper as required. A photo-electric exposure installation ensures uniformity of results from even widely different negatives. This is the best possible method yet introduced for filing purposes. Strip prints can also be had on transparent film for projection—these cost 5/- per 36 exposures. Give this service a trial. The strip prints are made in Britain's finest D. & P. works, and the finest quality work is guaranteed.

Yet ANOTHER SERVICE for the MINIATURIST

Striving at all times to render the most useful and intelligent service for the development and after-treatment of miniature films, we have now standardised a new and harmless hardening process to which all films 35-mm. wide, developed by either our ordinary or "Microlux" (Keg.) process, are subjected.

No charge is made for this service, which ensures that your valuable negatives are immune from the thousands of small surface scratches which so easily ruin unprotected negatives. To scratch films which we have processed can now only be done by brutal mishandling.

"MICROLUX" and "INDIVIDUAL" MINICAMERA DEVELOPING

Films developed by this process will enlarge to over twenty times without showing any grain. All films for "Microlux" development must have at least twice the ordinary exposure—providing this is so, we can assure the photographer of negative quality which cannot be equalled. Prices: Leica, Contax and similar films: 36 exposures, 4/6; 12 or 18 exp., 3/6. All other 6, 8, 12 or 16 exposure films (up to 3 1/4 x 2 1/4 size) per film 3/6.

Note.—When sending films for this special treatment it is more than usually necessary to advise us as to the make and type of film used. Literature free on request.

WARNING—"AUTOMAX" (REGD.) PRINTS

It has been brought to the notice of Master Photo Finishers Ltd. (Wallace Heaton, Managing Director), that a number of firms have been supplying prints of their own, under the description of "Automax." Please note that these prints are the particular product of Master Photo Finishers Ltd., and that "Automax" is their registered trade mark. Anyone detected in supplying under the description "Automax" prints which are not made by this Company will be proceeded against.

"Automax" Prints can be ordered from Wallace Heaton Ltd., of 127, New Bond Street, London, W.1, and from their branches, also from the branches of City Sale & Exchange (1929) Ltd., and from other dealers who are authorised by Master Photo Finishers Ltd. to retail "Automax" prints. No print is a genuine "Automax" unless it bears the trade mark "Automax" printed on the back. "Microlux" (Regd.) is also a registered trade mark belonging to Master Photo Finishers.

5d. A DAY FOR SHOTS LIKE THIS

with a new Rolleicord

MODEL '1A

That's all it costs to buy one of these popular twin-lens reflexes at Wallace Heaton's. Why not get yours now and be prepared for a holiday season of photography at its best? Landscapes, indoor snaps, speed subjects, are a few of the things you can take better with a Rolleicord. Rolleicord 1a is the biggest value to-day in twin-lens roll-film reflexes. Takes 12 pictures on $3\frac{1}{2} \times 2\frac{1}{2}$ roll film for 1/-, shows the picture full size and right way up on the ground-glass screen. Easy to use, easy to get dead-sharp focussing. Built to the well-known "Rollei" standard. Can be adapted for plates and ciné film and takes all Rolleiflex accessories except the angle mirror. Has art leather-covered body. Fitted with f/4.5 Zeiss Triotar lens and Compur shutter, speeded to 1/300th sec., T. & B.

Cash price **£12 : 10 : 0**

Competition. I agree to the rules and conditions.
Camera used

Signed

WALLACE HEATON'S NEW "TRAVEL SNAPS"

PHOTOGRAPHIC COMPETITION

Any amateur may enter, using any camera or materials. Mountain scenery, the embarking of passengers, "crossing the line," Eastern bazaars, pictures of famous beauty-spots—pictures taken at home or abroad, can all be sent in. All entries will be judged on their photographic excellence.

FIRST PRIZE £25 Cash **WEEKLY PRIZE 21/-** Cash

HERE ARE THE SIMPLE RULES:

All entries to be judged by Wallace Heaton Ltd., whose decision shall be final.

AMATEURS ONLY (Full name, address, title of entry and coupon on back of each entry).

ANY MAKE OF CAMERA OR MATERIALS. DEVELOPED, PRINTED OR ENLARGED ANYWHERE. ANY SIZE MOUNTED OR UNMOUNTED (not less than 8x6 unmounted is recommended). SPOTTING ONLY TO REMOVE DEFECTS (no faking or retouching).

WALLACE HEATON LTD. HAVE THE RIGHT TO PURCHASE THE NEGATIVE AND COPY. RIGHT OF ANY PHOTOGRAPH SUBMITTED FOR TWO GUINEAS. (If a guinea prize-winner for an extra guinea.) Copyright of the £25 prize-winning photograph and negative become the property of Wallace Heaton Ltd. without further payment.

Prizes are 21/- each week and 6 Certificates of Merit. £25 (twenty-five pounds) for the best photograph submitted during the competition (13 weeks).

If stamped addressed envelope is enclosed, every endeavour will be made to return photographs to competitors. No guarantee of safe return can be made, and no entries will be returned unless above is complied with.

A selection of the best entries will be held back at the close of the competition for exhibition in our galleries prior to their return. Our gallery is ALWAYS interesting, call and see it when in Town—free, of course.

Last week's prize winner was: Mrs. Eva Myfanwy, "Dodd," 7, Rawlinson Road, Oxford. ("Happy Holidays.")

Address your entries now to "Travel Snaps,"

Westminster offer
strictly limited
number only—

ZEISS IKON

Model 530/15

Super Ikonta

Each and all these fine
and much-sought-after
cameras are brand new,
as normally issued.

The magnificent specification includes
ZEISS IKON BUILT-IN REVOLVING
WEDGE RANGE-FINDER, famous
Zeiss f/4.5 Triotar anastigmat, Klio
shutter, 1/5th to 1/100th sec., and
delayed action, optical direct-vision
finder, rapid self-erecting front, etc.,
etc.

● Most attractive Picture Sizes ●

For 8 exposures 4½ x 2½ in. on normal spool, with
option of 16 2½ x 2½ by removable mask. Full
size is most pleasing shape and generous dimen-
sions; smaller is simply big enough to give
good picture of itself, yet exceedingly economical.

WESTMINSTER
Bargain Price

£9 : 17 : 6

12 monthly payments of 17/4.

● In view of this Out-of-Income
privilege (quite exceptional with
a Special Offer such as this)
earliest possible application is
strongly urged.

LATEST ENSIGN SELFIX "220" . . .

This camera, noted as a pioneer of the self-
erecting principle in the inexpensive camera,
is now offered in a new form, taking 12 pictures
2½ x 2½ or 16 2½ x 1½ at option. Direct optical
finders, adjustable to either size, mechanical
film counter similarly adaptable, focussing and
depth-of-focus scale and most handsome lustre
chromium finish.

F/7.7 Ensar anastigmat, Trichro shutter, speeds
1/25th, 1/50th, 1/100th, T. and B. **£2:15:0**

F/6.3 Ensar and Trichro shutter **£3:5:0**

9 monthly payments of 7/10.

Ensar f/4.5 anastigmat and Trichro shutter **£3:15:0**

9 monthly payments of 8/11.

Ensar f/4.5 and Prontor II shutter **£5:15:0**

12 monthly payments of 10/1.

Zeiss Tessar f/4.5 and Compur shutter **£9:15:0**

12 monthly payments of 17/1.

WESTEX MINIATURE

Lowest-priced high-precision
miniature. With famous f/2.9
Radonar lens, focussing to
3 ft. Prontor II D.A. shutter,
1 to 1/175th sec., T. and B.
Strong, beautifully made,
easy and delightful to handle,
optical direct-vision finder.
Takes 16 3 x 4 cm. on normal
V.F. spool **£5:12:6**

12 monthly payments of
9/11, 24 of 5/-.

With Vidanar f/4.5 and
Vario shutter to 1/100th sec.
£3:12:6

12 monthly payments of 6/6

● FOR CINÉ APPARATUS TOO
... YOU CANNOT DO BETTER
THAN GO TO THE WESTMINSTER

Still nothing quite like the ROLLEIFLEX

The camera that gains the prizes and pro-
duces the maximum of successful pictures.
The ROLLEIFLEX thinks for you, saves you
from forgetting, brings into photography a
certainty all its own. Absolutely automatic,
with Rapid Compur shutter, 1 to 1/500th sec.,
T. and B., f/3.5 Zeiss Tessar anastigmat, takes
12 pictures 2½ x 2½ on standard roll films, can
also be adapted for plates.

£25

12 monthly payments of 43/9, 24 of 21/11.

Always Something Good—at the WESTMINSTER . . .

Always some outstanding opportunity to secure
a real money-saving bargain in desirable high-
class apparatus—both new and second-hand.
See below for a notable instance. Remember,
too, that the unique Westminster OUT-OF-
INCOME Plan offers you not only the most
convenient terms of all but certain very important
advantages that you get only at the WEST-
MINSTER—nowhere else!

WESTMINSTER "VICTORIA"

Ultra-Modern Roll Film Cam-
era, for 16 pictures 2½ x 1½
on normal 3½ x 2½ spool.

Specially strong scientific one-
piece construction. Quick
self-erecting front, with f/2.9
Steinhell Cassar anastigmat,
focussing mount. Particularly
efficient optical finders. Quick
and easy loading, panchro-
matic safety covers.

Model I, Compur Rapid shutter, 1 to 1/400th sec., T. and
B. and delayed action, release on camera body **£7:19:6**

12 monthly payments of 14/-, 24 of 7/-.

ALL THE LATEST IN STOCK

ENSIGN MINIATURE MAGNAPRINT

The lamp body is constructed of light metal. It has a removable top fitted with a lamp-holder. Its tubular mounting is very rigid, free from vibration, and provides ventilation to the condensers. For focussing the body slides freely on the supporting column and clamps in the required position. Fine focussing is then carried out by the helicoidal lens mount which is provided with a large knob which locks it firmly in position at the required point. Takes half-V.P., Leica and Contax negatives. With f/6.3 lens.

£5:15:0
15 monthly
payments of 8/1.

LEICA III 28/6 a MONTH

for 24 months, or 15 monthly payments of 44/7. It is equally suitable for travel, sports, tele shots, or shots in the home or theatre. The negative material is inexpensive, and it takes up to 36 shots in rapid succession if desired. With f/3.5 Elmar lens.

Cash
price £31:16:0

AGFA KARAT

7/5 a MONTH
for 15 months.

Takes 12 pictures on 35-mm. film. Fitted with high-grade f/6.3 lens. Optical direct-vision finder. Easy loading. Takes clear and sparkling pictures. Ready for action at the touch of a button

£5:5:0

12 PICTURES, THIS SIZE, FOR 1P EACH
WITH THE 4 × 4 CM.

Rolleiflex

The miniature of miniature reflex cameras, giving twelve 4 × 4 cm. pictures on a popular vest-pocket size roll film. This model embodies all the well-known features of the 6 × 6 cm. Rolleiflex—it shows the picture full size and right way up on the focussing screen, and has the excellent feature of a magnifier fitted over the peep-window so that shutter speeds and lens apertures are shown up in magnified form. It has f/2.8 Zeiss Tessar lens and Compur Rapid Shutter, speeded to 1/500th sec., T. and B. This model is used exclusively by many of the leading exhibition workers. It takes the majority of the 6 × 6 cm. Rolleiflex accessories, and is a really versatile instrument. Price £26.

The 6 × 6 Rolleiflex taking 12 pictures on 3½ × 2½ roll film, with f/3.5 Tessar lens and Compur Rapid shutter. £25.

YOUR CHOICE OF CANDIDATE		X PERCENT
FILMS		
GLASS PLATES		

Whatever your choice — films or glass-plates — you may use either or both with the Compass. The new Compass roll-film back holds its own miniature roll-films of 6 exposures — a most convenient number for general or snapshot occasions. For those who prefer the special qualities of glass plates, these are available for use with the standard Compass camera back. Each patent Compass paper envelope is complete with plate all ready for daylight loading. Each negative can be developed when taken — there is no delay to complete a roll of film. Why not ask any Compass Dealer to demonstrate both types of back and the absolute simplicity of the unique Compass System of photography. An explanatory 48 pp. illustrated booklet will be forwarded on request.

You have to give us credit

... for making this really good camera. Inspect a Voigtlander Bessa for yourself—see how beautifully it is made, study its design and find how it incorporates every worth-while feature—from the shutter-release, fitted under the baseboard, to the three-point focussing system and the choice of high-grade Voigtlander Anastigmat lenses and speeded shutters. You will like it even more when you know the price; from 52/6 with F 7.7 (model illustrated) to £10 17/6 with F/3.5 lens and Compur-Rapid shutter, and optical finder.

Voigtlander BESSA

Ask at your dealer's for a demonstration—or write to-day for the interesting Bessa brochure to SCHERING LTD. (Voigtlander Dept. A) 185/192, High Holborn, London, W.C.1

CINE-KODAK "8"

With f/1.9 lens. Will make a movie shot the length of an average news-reel shot at the cost of less than sixpence a shot. It takes 25 ft. of double-run film, and makes movies of unsurpassed quality and brilliance. Daylight loading. Strong precision-driven spring motor. Exposure guide. Footage indicator and release lock for self-photography. **£15 CASH**

"THE CAMERA THAT THINKS FOR YOU"—and how!

THREE MODELS

Interchangeable lenses.

With Zeiss Tessar f/2.8=3 cm. £29 10 0
 With Zeiss Tessar f/3.5=3 cm. £26 10 0
 With Meyer Primotar f/3.5=3 cm. £23 10 0
 Interchangeable Telephoto Lens. Schneider Tele-Xenar f/5.5=5 cm. £10 0 0

- Shoots sequence pictures with machine-gun speed.
- Lens always in "ready" position—no withdrawing necessary.
- Film winds itself automatically.
- Shutter sets itself automatically.
- Film counter operates automatically.
- No double or overlapping exposures possible.
- Automatic "Zone" focusing gives needle-sharp definition and supersedes range-finders.
- Takes up to 50 exposures on Standard 35-mm. film.
- Dual cassette loading permits removal of any part of film at any time for development.
- Camera opens in daylight for changing from "pan" to colour film at any moment.
- With motor wound takes from one up to 24 exposures in quick succession, or singly.
- Motor can be left permanently wound.
- Incorporates filter suitable for "pan" or "ortho" films.
- Exposure automatically compensated when using filter.
- Shutter gives "Time" and from 1 sec. to 1/500th sec.—and all intermediate speeds.
- Weighs 14 oz.—just heavy enough to be held comfortably without risk of movement.
- Overall size only 4½×2½×2 in.
- Three view-finders in one, including "right-angle" for "candid" work.
- Daylight-loading spools available.
- Camera has stainless steel body, covered black morocco.

The Key to Success!

ILFORD LUSTRE BROMIDE *for ENLARGING*

To preserve the fine detail in enlargements from miniature negatives Ilford Limited have introduced Lustre Bromide—in several attractive surfaces. This exquisite paper, with its inherent brilliance and the soft beauty of its lustrous surfaces, brings out all the fine detail of the original negative and is eminently suitable for exhibition purposes.

For enlargements from miniature negatives the following three surfaces are especially suitable:—

- SMOOTH LUSTRE
- FINE GRAIN LUSTRE
- CREAM FINE GRAIN LUSTRE

For broad effects the following are recommended:—

- GRAINED LUSTRE
- ROUGH LUSTRE

And for extremely broad effects—

- CREAM EXTRA ROUGH LUSTRE

VOL. LXXXIV. No. 2547.

ON a previous occasion we drew the attention of readers to the necessity for observing the few simple rules that deal with the sending of enquiries and prints for criticism, and we must again impress this on all who avail themselves of the service which we give freely. We are compelled to do this in view of the enormous increase during the past year in the number of queries that reach us every week. While we are glad to know that we can help our readers in their search for knowledge we expect that they will at least pay attention to the small matter of a stamped addressed envelope if they want a reply to a string of questions or criticisms of their prints. During the period mentioned a very considerable number of the many thousands who have sent us queries on technical and pictorial matters have not only done so without observing this rule but have ignored the other rules also. In fairness to those who take the trouble to read and observe the conditions (which are printed each week on the last page of editorial matter) we must make it clear once more that any query or prints for criticism that reach us without any attention being paid to the method of procedure prescribed will not be dealt with.

Back to Simplicity.

Will the autumn exhibitions reveal a welcome return to simplicity? Such a return is about due. We have had a long period of straining after the unusual. Sometimes it seems almost a pity that the word "angle" has got into photographic diction; it has been made the excuse for so many weird effects. It used to be thought a sign of the

TOPICS of the Week

HOLIDAY-MAKING ON THE BROADS.

Bathing subjects, in such surroundings as these, offer distinct opportunities for pictorial treatment.

(See article, "Pictures of Bathers," in this issue.

novice if there was distortion in the picture, but now it is coming to be reckoned the hall-mark of the expert. Many pictures suggest that their creators must be contortionists. Even portraits are often no longer simple likenesses of the subject, but human analyses or psychological interpretations. It is quite time that workers came back to simple things, to ordinary landscapes treated in an ordinary way, to unsophisticated portraiture, to common subjects seen as the human eye sees them, and not the eye of the giraffe or of the slug. The great value of the strain after the unusual is that, after it has been exhausted, one is so much better enabled to appreciate the loveliness of the ordinary. Just as the great value of jazz music on the wireless is to accentuate the beauty of the silence when it stops.

Cinemas and Shells.

Events in Shanghai must be upsetting to the motion-picture industry, for Shanghai is one of the places most avid for films in the Far East, and a big producing centre too. It has forty-four picture theatres, two or three of them holding three thousand people. The latest to be constructed is a magnificent place, lavishly decorated by Chinese and foreign artists. Some of the theatres devote themselves to the showing of Chinese pictures exclusively. The latest vogue in Shanghai is open-air cinema projection, for which it has a special park, away from street noises and the interference of the neon lamps and motor lights. Of the fifty-six Chinese producers of film, forty-eight are located in Shanghai. Nanking has its ambitions in the same direction. In the latest theatre in that city the

sound equipment alone has cost £80,000. Recently at Nanking a Chinese picture studio has been opened at a cost of £60,000. Unfortunately this fantastic world, which in some ways represents an escape from reality, is no better protected than the everyday world against shells and bombs.

Summer Lightning.

As stated in an article in a recent issue of "The A.P." (page 188), "lightning at night is easy to take

with even the simplest camera," and being so it is a remarkable fact that photography should have been in existence for over forty years before a passably good rendering of a forked flash was secured. A correspondent reminds us that it was on September 2nd, 1882, Mr. W. N. Jennings, of Philadelphia, after several attempts, managed to get a promising result, and it was not until three years later (August 15th, 1885) that a really perfect rendering was secured. Hand cameras and

films were not then in everyday use, and photography was more difficult than it is to-day. Lecturing on the subject at New York shortly after getting successful results, Mr. Jennings said: "Now that the camera has shown us lightning in its true form, it behoves the artist of pencil and brush, who would truthfully depict a thunderstorm, to study nature, and never again should an angular zig-zag be made to stand for the graceful autograph of Jove."

"The Amateur Photographer" EXPOSURE TABLE—September

EVERY MONTH a brief exposure table will be provided for the assistance of our readers in their practical work. A glance at the current approximate exposures as here given will serve as a reliable guide for most purposes. The subjects will be varied to suit the time of year. The following exposures will serve as a working guide for any fine day during the month, between the hours of 10 in the morning and 2 in the afternoon, with the sun shining, but not necessarily on the subject. Stop used, f/8. The exposure should be doubled if the sun is obscured, or if stop f/11 is used. For f/16 give four times the exposure. For f/5.6 give half. From 9 to 10 a.m. or from 2 to 3 p.m. double these exposures. From 7.30 to 9 a.m. or from 3 to 4.30 p.m., treble them.

N.B.—The times given above are by "sun time." The exposures, therefore, which are laid down as suitable for 2 to 3 p.m., for instance, will be those to be given between 3 and 4 p.m., by the clock, during "summer time."

SUBJECT.	Ultra-Rapid.	Extra-Rapid.	Rapid.	Medium.	Ordinary.	Slow and Process.
Open seascapes and cloud studies	1/700 sec.	1/500 sec.	1/300 sec.	1/50 sec.	1/75 sec.	1/30 sec.
Open landscapes with no very heavy shadows in foreground, shipping studies or seascapes with rocks, beach scenes	1/350 "	1/200 "	1/150 "	1/75 "	1/30 "	1/20 "
Ordinary landscapes with not too much foliage, open river scenery, figure studies in the open, light buildings, wet street scenes	1/200 "	1/150 "	1/75 "	1/30 "	1/20 "	1/10 "
Landscapes in fog or mist, or with strong foreground, well-lighted street scenes	1/150 "	1/75 "	1/30 "	1/20 "	1/10 "	1/6 "
Buildings or trees occupying greater portion of picture	1/50 "	1/20 "	1/12 "	1/8 "	1/4 "	1/2 "
Portraits or groups taken out of doors, not too much shut in by buildings	1/20 "	1/10 "	1/5 "	1/3 "	3/4 "	1 1/2 "
Portraits in well-lighted room, light surroundings, big window, white reflector	1/8 "	1/4 "	1/2 "	1 "	2 secs.	4 secs.

As a further guide we append a list of some of the best-known makes of plates and films on the market. They have been divided into groups, which approximately indicate the speeds referred to above.

The BEST FROM HOLIDAY EXPOSURES

The photographer returning with a big batch of exposed plates or films to develop will naturally be anxious to see his results as soon as possible. This should not be allowed to interfere with his usual care in handling, and he will be well advised to devote attention to the points dealt with in this article.

WHEN the photographer is home again after the summer holiday, he looks forward with pleasurable anticipation to developing and printing his holiday exposures. For most of us the all-too-brief holiday is, photographically speaking, the most fruitful period of the whole year; partly because more time and energy are available for prosecuting our hobby, and partly because the stimulus that new surroundings always give has enabled the photographer to see, and hence to record upon his film, many excellent subjects which he would have passed by without noticing in the familiar purlieus of his own home town.

Developing the films has the effect of prolonging the pleasure of the holiday. As each roll is taken from the hypo and inspected, memories of half-forgotten joys come crowding back into the mind, and the photographer relives happy incidents that might never have been recalled at all but for the fact that they have been put upon record on the film.

Holiday memories and holiday pictures are alike irreplaceable; a natural anxiety to see the results as soon as possible should therefore not be allowed to stampede the photographer into hasty and careless development.

Things to Consider.

In these days there is the tendency to make numerous exposures. Small cameras, inexpensive negative material, the capacity to carry a large supply of film, and the practice of making several exposures upon a good subject all contribute to the fact that the modern photographer has a far larger batch of exposures to develop on returning from his holiday than would have been the case twenty years ago.

The photographer processing his holiday exposures should beware of the temptation to develop too large a number at one time. A rule should be made to confine the number processed at one time to the number ordinarily dealt with.

A larger number of negatives will not only need greater space for manipulation, but will also call for extra apparatus if they are to be

effectively fixed and washed. It is only too easy to continue developing plate after plate, or film after film, forgetting that congestion must inevitably arise either at the fixing or the washing stage. This involves the likelihood that one or both of these important operations will be ineffectively carried out, so endangering the permanence of the results. Handling large batches of negatives at one time also very gravely increases the risk of mechanical damage, the slightest trace of which spells hopeless ruin to the modern miniature negative.

No Experimenting.

The end of a holiday is no time for experimenting, for should anything go wrong the precious exposures, all made upon subjects which cannot be taken again in case of failure, may be irretrievably lost. If, therefore, you hear of a new developer which someone says gives better results than he has ever seen before, the information should be shelved until it can be tested by experiment on a film exposed specially for the new formula.

Your friend may be right, and the new developer may do all he claims for it, but you will be infinitely safer with the developer you have been using for the past six months. With it you know, from previous experience, just how long to develop to obtain the exact kind of negatives you like.

Much the same considerations apply to apparatus and methods. It is not wise, for example, to buy a tank and use it for the first time for developing films that cannot be replaced if anything goes wrong. Nothing, of course, *should* go wrong—but then it might; mistakes are so easily made with unfamiliar apparatus.

Old Methods Best.

And if development is usually done in a tank, the fact that there are a large number of films to be developed should not be regarded as sufficient reason for doing some by the "see-saw" method unless the photographer is accustomed to it. Scratches and uneven development are only too likely to reward the first fumbling trials in pitchy darkness.

In short, the old familiar methods should be used, each film receiving as

much consideration as if it were the only one exposed during the holiday.

The negatives, when finished, should be put away carefully. It is a good plan to put them away in three batches. Perfect negatives form one batch, those needing reduction form the second, while the third contains those that require intensification. Each negative should be examined for pinholes and similar defects of a mechanical nature, and if a sufficient number are found to need attention in this respect, they may be placed in another group.

When these after-processes have been carried out—if they are necessary—the holiday set of negatives may be regarded as ready for the making of rough prints.

Proofing.

The next step is the making of proof prints from all the negatives. The photographer should not judge the success or otherwise of any negative until a print has been made from it.

In the case of very small negatives it is a good plan to make enlargements of medium size—say postcard or half-plate—rather than contact prints. This will ensure that the possibilities of the negatives are not overlooked.

Care should be taken that the proof prints are the best that the negatives are capable of producing. We have known of cases where the photographer has not realised the quality of his negatives simply because the proofs were of poor quality.

In General.

A set of prints from the holiday negatives will be useful for future reference. There should be some that may be used for exhibition or competition prints. Others may be more suitable for making lantern slides, possibly for the illustration of a lecture. There may be some worth filing away for the sake of the Press value they may have next year.

It is a good plan to have an "ideas" book with regard to the holiday harvest in which notes may be made for future reference. Opportunities are often lost through the fact that the value of the subject, or even its very existence, slips from the photographer's memory. This an "ideas" book avoids.

Figures by the

By F. ALSOP PARTINGTON.

There is the harbour as a whole, or as much of it as the camera can include, and this in favourable lighting and with attractive clouds can often make a very worth-while picture. More numerous opportunities are afforded by the smaller things, whether it be a pattern of small boats seen in the water below the quays, the larger sea-going boats moored up for loading or unloading their cargoes of fish, coal or timber, or the cranes, derricks and other paraphernalia of the wharves.

But all these subjects are rather usual ones, and the pictorial opportunities that they offer can be taken advantage of by any photographer who may happen to visit the seaport in question. If a figure is included in the pictures, and still more if it is the centre of interest, each photograph taken at once becomes different from all others, since people never hold the same pose or expression for long.

PREPARATIONS.

MOST of us manage to go down to the sea at some time during the year, and although the beach, especially if rocky, can provide numerous subjects, particularly where the coastline itself is interesting—as, for example, in Cornwall—there can be no doubt that the most fruitful happy hunting-ground of all is to be found at the nearest harbour or seaport.

WORKERS OF THE WHARVES.

AT THE HARBOUR STEPS.

It is rather a pity that many workers who take themselves seriously consider that these subjects are outside their field, and regard a subject containing figures as more suitable for the pressman than for the pictorialist. Judging by the general choice of pictorial subjects, this view was probably the "correct" one some few years ago; but fashions, in pictures as in everything else, have a way of changing, and a very large proportion of the most successful exhibition pictures of the present time, even when not in any sense portraits, are studies of figures or of views containing them.

Quayside

Quayside subjects, though always attractive, are rendered even more convincing by the inclusion of figures.

THE YOUNG FERRYMAN.

The illustrations on these pages are all figure-studies of one type or another. Most of them are unposed, and depended for their production on a quick eye for a subject and a ready finger on the shutter release. Down by the sea, where light is plentiful, it is possible to use a fairly

GAMINS OF THE HARBOUR.

THE ARTIST'S HOLIDAY.

small stop to make focussing easy, and a moderately fast shutter speed to avoid camera-shake through too rapid shooting, so that no great technical skill is needed to produce results well up to the standard of those shown here.

A GOOD DAY'S WORK.

Readers' Hints, Tips and Gadgets

FITTING YOUR CAMERA WITH A CONVENIENT SHUTTER RELEASE.

MINIATURE cameras have for some time been fitted with a convenient shutter release, usually placed on top and to the right of the eye-level view-finder, so that when the camera is held between the two hands up to the face, the shutter release is right under the first finger of the right hand. It is not so easy to fit a shutter release on the body of a folding camera which has the shutter fitted between lenses, owing to the difficulty of making it sufficiently flexible to fold up when the camera is shut. The result has been that folding cameras have been left until recently with the shutter release on the lens carrier, which is about the most awkward position it could be in for a camera fitted with an eye-level view-finder. It usually means that the right hand has to leave go of the camera in order to release the shutter.

There is, however, a very easy way of fitting, for the cost of a shilling or two, a convenient shutter release to any folding camera which is made to take an antinous release. Purchase an antinous release 10 in. long; a shorter one is no good, and a longer one is unnecessary. Your local dealer probably will

not have one in stock, but will soon get it for you. Bind the end with the

operating knob to the carrying-handle at the top of the camera, keeping the operating knob on the same side as the eye-level view-finder, and taking care not to bind it to the handle over too great a length so as to prevent the handle from folding flat against the camera. The appearance is improved by painting the string with a matt black paint such as is used for painting the inside of a lens hood. The antinous release is now permanently attached to the camera and cannot get lost.

To use it, open the camera and pull out the lens. Take the end of the antinous release which screws into the shutter and twist it half a turn anticlockwise. Push the screwed end of the release into its socket on the shutter and leave go of it. The release will untwist and in doing so will screw itself into place. After setting the shutter everything is ready for taking the photograph. The accompanying photograph shows such a release fitted to a folding camera—note how the camera is gripped with both hands and how the shutter release is right under the first finger of the right hand.

K. S. B.

AN EFFICIENT BALANCE.

IT is possible to use the maker's formula, and thus get the finest results, when one is able to make up accurately the solutions required. The possession of a good pair of scales is necessary, and money spent on such is a good investment. An accurate balance, capable of weighing from a few grains to two ounces can, however, be easily made from odds and ends, and I have used such a balance with complete success, so briefly describe it here.

A piece of wood $18 \times 1 \times \frac{1}{4}$ in. has bored in its centre a $\frac{5}{8}$ -in. hole, which is sandpapered smooth. The wood is then cut in half, so leaving a semi-circle in each piece. These two pieces are fixed in an upright position to a base $10 \times 2\frac{1}{2} \times \frac{5}{8}$ in. by screws or a dovetail joint.

The beam is made from a piece $8 \times 1 \times \frac{1}{4}$ in., which should be marked carefully in the middle, and a piece of knitting needle or steel wire driven tightly through to project 2 inches each side. Holes are bored exactly $3\frac{1}{2}$ inches from the middle, and S-hooks fashioned from wire are made to swing freely in these holes.

Two tin lids of equal size form the pans, and are suspended from the hooks by means of thin string tied in holes punched in the tin by means of a small nail.

Should the scale not balance, it may be remedied by adding a small counter-weight, such as a piece of coiled wire, to the hook on the light side, or filing the end of the beam on the heavy side, or adding a blob of solder to the light pan.

Two watch glasses are convenient, as they can be removed for cleaning, or a piece of paper may be placed in each pan to avoid contaminating them with chemicals.

Weights should be purchased or made from strip brass and lead to match a borrowed set. At a pinch, coins can be used as a substitute.

Remember the chemist balances his scale, and does not let it bump down on the ingredient side like the grocer.

For very accurate weighing, as when making weights to match existing ones, the scientific method is to balance by substitution. The weight is placed in the right pan and balanced by anything convenient—scraps of lead, balls of paper, etc. The weight is then removed, the object to be

weighed substituted, and balance once more obtained. In this way an exact measure is obtained, even when the balance is slightly inaccurate.

A. T. BAILEY.

PRICES ARE DOWN

Temporarily! At this time of the year, fifty per cent of our highly exclusive and discriminating customers have left us to sail the seas in their yachts, to people remote and gorgeous plages, to imperil their shirts at the tables—or in some equally attractive manner have removed themselves from the range of our appeals, however seductive.

For this reason, prices are this week down. The cameras described in the following columns are in most cases indistinguishable from new ones; they carry our guarantee over an indefinitely prolonged period against inherent defects of any kind, and they are backed in each case by our unparalleled service. Yet the prices have in most instances been reduced below those asked by private (and consequently unknown) advertisers for similar apparatus. For the discriminating purchaser, this is definitely the best time of the year—better even than the winter—to buy a miniature camera.

COMPASS CAMERAS

It has occurred to us that misunderstanding might have arisen in connection with our special offer of Compass cameras in *The Amateur Photographer* of 18th August. We would like to emphasise that the cameras offered were not new ones, but were, however, cameras of the latest type and ones which have received very little use. We are still able to offer one or two of these remarkable little instruments at the second-hand price of £19 10s.

SPECIAL

Kodak Bantam Special, f/2 Ektar lens, maker's box and instructions. As new £19 17 6

Robot, f/2.8 Tessar, 2 cassettes, ever-ready case. As new £22 17 6

A very special Kine-Exakta Outfit comprising a camera with f/3.5 Exaktar lens, a 13.5-cm. f/4 Sonnar (chromium model), a 4-in. f/5.5 Ross Teleros (chromium), 5 Leitz extension tubes for portraiture and copying, and a Leitz lens hood. The whole outfit was specially obtained and adapted only a few weeks ago and is indistinguishable in any way from new. Total cost about £67.
Sale price £45 0 0

LEICAS :

Leica IIIa, f/2 Summar lens, ever-ready case. As new £35 10 0
Leica III, chromium, f/2 Summar, E.R. case. As new £31 10 0
Leica III, chromium, non-collapsible, f/2 Summar, E.R. case. As new £30 0 0
Leica II, black, f/3.5 Elmar, E.R. case. Practically as new £19 10 0
7.3-cm. f/1.9 Hektor, Rectilinear focussing model with latest chromium finish. As new £19 17 6
2.8-cm. f/6.3 Hektor, chromium. As new £8 10 0
3.5-cm. f/3.5 Elmar, nickel. As new £6 10 0
5-cm. f/2.5 Hektor, nickel. Excellent condition £6 15 0
5-cm. f/1.4 Zeiss Biotar, coupled for Leica. As new £24 0 0
Leitz Varob Enlarging Lens. Excellent condition £3 15 0
Megoflex Attachment for Leica £2 15 0

CONTAXES :

Contax Model III, f/2 Sonnar, E.R. case. As new £49 10 0
Contax Model II, f/1.5 Sonnar, E.R. case. As new £32 10 0
Contax Model II, f/2 Sonnar. As new £39 17 6
Contax Model I, latest pattern, f/2 Sonnar. As new £29 15 0
Contax Model I, as above, but fitted f/2.8 Tessar £22 10 0
2.8-cm. f/8 Tessar, chromium. As new £8 10 0
13.5-cm. f/4 Sonnar. Excellent condition £15 15 0
4-cm. f/2 Biotar, with special finder. As new £12 17 6
Plate Back with one slide for Contax I. £2 17 6
Contameter for Contax or Super Nettel. £6 17 6

CONTAFLEXES :

Contaflex, f/1.5 Sonnar, E.R. case. As new £58 10 0
Contaflex, f/2 Sonnar, E.R. case. As new £49 10 0
8.5-cm. f/4 Triotar. As new £11 10 0
13.5-cm. f/4 Sonnar for Contaflex. As new £15 15 0
3.5-cm. f/2.8 Biogon for Contaflex. As new £17 10 0

MINIATURE CAMERAS FITTED WITH COUPLED RANGE-FINDERS :

Super Ikonta 530/2, f/3.8 Tessar, Rapid Compur. As new £15 10 0
Super Ikonta 530/2, f/4.5 Tessar, Normal Compur. Excellent condition £11 10 0
Super Ikonta 530/2, f/4.5 Tessar, Rapid Compur. Excellent condition £12 10 0
Super Ikonta 530/1/2, f/3.8 Tessar, Rapid Compur. As new £18 19 6
Super Ikonta 530, f/3.5 Tessar, Rapid Compur. As new £13 18 6
Super Ikonta 530, f/3.5 Tessar, Normal Compur. As new £12 19 6

CHAMPLIN 15

Where films are of particular value, we suggest that they be sent to us for processing in Champlin 15. With our new stock developer prepared with chemicals of exceptional purity we are finding the extraordinary claims for Champlin 15 to be fully justified. We are producing with this formula negatives of outstanding quality demonstrating remarkable shadow detail coupled with extreme fineness of grain even from negatives that have suffered from shortness of exposure. We have already received hundreds of letters of congratulation from delighted customers. Processing of films in Champlin 15, inclusive of treatment with Scratchproof, costs 3s. per ordinary spool and 3s. 9d. for Leica size spools.

NOTE.—Champlin 15—the authentic American formula—may now be had from us in the form of a concentrated solution requiring only the addition of water for use. Price per bottle, to make 20 oz. of developer, 4s. 9d., postage 6d.

Super Ikonta 530/16, f/2.8 Tessar, Rapid Compur. As new £20 0 0
Super Ikonta 530/16, f/3.5 Tessar, Rapid Compur. As new £17 19 6
Baldaxette 1, f/2.8 Xenar, Compur, special parallax adjusting view-finder. As new £12 17 6
Kodak Regent, f/3.8 Xenar, Rapid Compur. As new £12 17 6
Voigtlander Super Bessa, f/3.5 Heliar. As new £13 18 6
Weltur, f/2.9 Radionar, Compur. As new £12 15 0
Roland, latest chromium model, f/2.7 Plasmat, Rapid Compur. As new £18 15 0
Ensign Muxlex I, f/3.5 Ensar, case. As new £11 17 6
Ensign Muxlex I, f/2.8 Tessar. As new £17 10 0
Peggy 2, f/2.7 Plasmat, film-cutting device, filter, case £17 17 6
Peggy 2, f/2.8 Tessar, film-cutting device. £17 17 6

MINIATURE REFLEXES :

Latest Automatic Rolleiflex 6×6, f/3.5 Tessar. As new £18 17 6
Latest Automatic Rolleiflex 4×4, f/2.8 Tessar, Rapid Compur. As new £18 17 6
Automatic Rolleiflex 6×6, f/3.8 Tessar, Compur, case. Excellent condition £14 10 0
Rolleiflex 4×4, f/2.8 Tessar, Normal Compur. Excellent condition £14 10 0
Rolleicord II, f/3.5 Triotar, E.R. case. As new £13 10 0
Rolleicord II, f/4.5 Triotar. As new £10 17 6
Rolleicord I, f/3.8 Triotar. Practically as new £10 10 0
Rolleicord I, f/4.5 Triotar. Excellent condition £7 10 0
Pilot Reflex, f/2.8 Tessar, Compur. Excellent condition £12 15 0
Ditto, fitted f/3.5 Tessar £10 15 0
Lever-wind Multispeed Exakta Model B, f/1.9 Dallmeyer Super-Six, improved type. As new £24 10 0
Exakta Lever-wind Model B, f/1.9 Primoplan, case. As new £26 10 0
Exakta Lever-wind Model B, f/2.8 Tessar. As new £21 10 0
Exakta Lever-wind Model B, f/3.5 Tessar. As new £17 15 0
Exakta Model A, f/3.5 Tessar, case. Excellent condition £12 15 0
5.5-cm. f/8 Wide-angle Tessar for Exakta £9 0 0
12-cm. f/6.3 Tele-Tessar for Exakta. As new £10 10 0
6-in. f/5.5 Tele-Megor for Exakta. As new £7 15 0
6-in. f/5.6 Dallon for Exakta. As new £5 18 6
18-cm. f/5.5 Tele-Megor for Exakta. As new £14 15 0
25-cm. f/5.5 Tele-Megor for Exakta. As new £22 0 0
Ikoflex II, f/3.5 Triotar, ever-ready case. As new £12 5 0
Voigtlander Superb, f/3.5 Skopar, case. Excellent condition £10 17 6
Voigtlander Superb, f/3.5 Heliar, case. As new £14 17 6
Ikoflex I, f/4.5 Novar, 3-speed shutter. £5 5 0
Korelle I, f/2.8 Tessar, case. As new £14 17 6
Korelle I, f/4.5 Enoldar. As new £5 17 6

MISCELLANEOUS CAMERAS :

Voigtlander Virtus, f/3.5 Heliar, 2 filters, Proxar, lens hood, case. Absolutely as new £8 19 6
520 Ikonta, f/3.5 Novar, Rapid Compur, case. As new £7 5 0
Baby Ikonta, f/3.5 Novar, Compur, case. Excellent condition £5 15 0
Certo Super Sport Model C, f/2.8 Tessar. As new £10 10 0
Certo Super Sport, f/2.8 Xenar, 3 slides and focussing screen £9 7 6
Ihagee Parvula, f/2 Xenon. As new £11 15 0
Welta Gucki, f/2 Xenon. As new £8 17 6
Zeiss Kolibri, f/2 Biotar. Excellent condition £12 5 0
Pupille, f/2 Xenon. Excellent condition £12 17 6
Voigtlander Perkeo, f/3.5 Skopar, Compur. Good condition £5 5 0
Plaubel Makinette, f/2.7 Anticomar. Good condition £9 17 6

**IMPORTANT**

All Zeiss Ikon 24×36mm. miniature cameras sold at current listed prices in Great Britain or Ireland carry the three-year written guarantee. Ask your dealer for particulars.

Do you know what this is ?

CONTAX II... Zeiss Ikon miniature with combined distance meter and view-finder in one eye-piece... focal-plane shutter to 1/1,250th sec... 15 interchangeable Zeiss lenses... and many other exclusive features.

The illustration shows the pressure plate fitted to the Contax, Contaflex, Nettax and Super Nettel—Zeiss Ikon 24 × 36 mm. miniature precision cameras. This perfectly plane pressure plate ensures that the film will run through the picture aperture without scratching the emulsion and at the same time it presents a perfectly flat surface to the focal plane.

With miniature cameras it is essential that the negative material will pass through the camera with strict accuracy, otherwise definition will be impaired. In our opinion perforated cine film unbacked by protective paper is the only form of negative material which can be carried through the camera with sufficient precision for modern miniature camera practice. Therefore all Zeiss Ikon cameras for serious work taking a smaller picture size than 2½" × 1¾" now use 24 × 36 mm. perforated cine film as negative material either with the well-known daylight loading Contax spool or as cartridges, but always without paper backing.

Write for a copy of "Contax Photography" which tells you all about Zeiss Ikon miniature precision cameras, and the extra advantages they will give for your branch of photographic work.

ZEISS IKON LTD., 11, MORTIMER HOUSE, MORTIMER STREET, LONDON, W.1

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

Animal Photography with a Miniature

By
DONALD G. SHELDON.

A SENTINEL ON DUTY.

ANIMAL photography is a tricky business with any camera. Users of both the lordly reflex and the humble box camera must contend with the sudden movements of their models, except, perhaps, when these are the somnolent porker or the contemplative cow. Try your luck with a couple of kittens or a litter of puppies, and you will soon agree with me.

STALKING.

The smaller the animal, the more difficult the task. Even with a miniature the main stumbling-block is focussing, for every movement of your model sends the picture, taken with a wide-aperture at close range, completely out of focus. With a reflex, or a camera with a range-finder, focussing difficulties are lessened, but they are by no means abolished. How many perfect poses have been lost because of the second wasted in checking that the model is still in focus?

Unexpected Movement.

And then there is movement. No matter how elaborate are the refinements of your apparatus, the kitten which jumps or the donkey which tosses its head just as you press the trigger will ruin your choicest picture. If you get one perfect shot in six you are lucky! Using large-size plates, roll films or film packs, this is an expensive game; but with a miniature whose exposures cost a penny or less you can afford to keep on till you get what you want.

Large Aperture Needed.

Proper rendering of the fur or skin is an important matter, and it is spoilt by under-exposure. Rapid shutter speeds are usually required in order to cut out movement, so it follows that a large aperture will often be needed if fur texture is to be retained. Precision miniatures are mostly fitted with lenses having apertures of $f/4.5$ or greater, so that even at high speeds exposures adequate for good renderings are possible.

Of course, there are many larger cameras having wide-aperture lenses. But in their case the use of full aperture introduces two further snags—the very small depth of focus, and the difficulty of accurate focussing with the longer focus lenses employed. The short-focus lenses fitted to miniatures show at full aperture sufficient depth of focus to

COLD CUNNING.

cover all practical needs. When taking small animals at close range, this question of depth of focus is all-important.

For all-round excellence in the rendering of tone values, panchromatic materials are recommended. Though ortho films will give good results with animals whose coats are mainly of black, white and grey shades, obviously they cannot do justice to the tan and reddish hues which are fairly common.

AN HOUR OFF.

Easier Focussing By S. STARKS-FIELD.

IN spite of the powerful magnifier fitted in the focussing hood of the modern twin-lens reflexes, owners of these cameras sometimes find difficulty in deciding when the image on the ground-glass screen is critically focussed. The device described and illustrated makes hair-sharp focussing a certainty, combining as it does the advantage of the range-finder principle with the ground-glass screen.

If the finder-lens is divided by means of an opaque bar, a double image will result on the screen if the lens is not correctly focussed, but the two images approach closer and eventually coincide when the lens is correctly set.

The device is quite easily-made by cutting a circular piece of good-quality glass (a piece cut from a spoilt plate

will serve, as the glass is not too thick) and mounting it in a short cardboard or metal tube to fit over the lens-mount on the finder-lens. A piece of black paper cut from an envelope in which bromide paper is packed should be gummed on to the glass to serve as the opaque bar. The bar should occupy a horizontal position when focussing on an object with a preponderance of horizontal lines, while the vertical position will be found more suitable when taking subjects in which the majority of the lines are upright. The greatest advantage accrues when the fitting is used in conjunction with the magnifier in the focussing hood.

It may be added that the same device will be found of considerable assistance in focussing the enlarger.

Temperature and the Tank By G. K. SEAGER.

I AM taking it for granted that everybody who develops films in a tank knows the importance of having its contents at the right temperature. The latter condition is all too often taken for granted, and variation in the densities and contrasts of strips of negatives, frequently attributed to "mystery" or other vague reasons, is often due to nothing else but the fact that the solution has changed in temperature during the twenty or thirty minutes which elapse between taking out the thermometer and pouring the developer off the film. Even during the time the film is being wound into the apron the temperature of the developer may alter if steps are not taken to prevent this occurrence.

Anyone who feels cocksure about his methods is hereby invited to take the temperature of his tank again towards the end of the developing process. It is, of course, in cold weather that a drop is most likely to occur, but it may equally happen in the warmer months of the year if one works in a draught, or in a cool place such for instance as in a scullery late at night. After all, a pint is not so large a volume that it can be expected to retain for long a temperature which is either higher or lower than the surrounding atmosphere.

By surrounding the tank with a bigger bulk which is of the same desired

temperature, the right level of warmth can be maintained for a considerably longer period. A basin of water, as seen in the illustration, is a very simple and convenient arrangement for achieving this object. If not quite warm enough, it is so easy to stand the whole on a "bead" of gas to warm it up a trifle, while in hot weather water from the cold tap, especially if this is allowed to run for a while, will generally provide a good source of "coolth." It is a very good plan to stand the tank or other vessel containing the solution in the basin of warmed or cooled water while loading the film on to the reel, which can then be put into a closed box the while one again checks the temperature of the developer. If it be right, at that point the light can be turned out and the film put in the tank. In my own experience it is better to develop for a standard time at a set temperature than to alter the time according to variations in the latter. Although it seems a little more trouble, negatives of more even contrast are obtained, and what one may lose in time on the swings of negative development, one regains over and over again on the

roundabouts of enlargement printing.

In extra-warm weather it is a good plan to put a block of some kind in the bottom of the basin, so that the lip of the tank is just above the level of the quite filled basin. Then the whole can be stood in the kitchen sink, and the cool water from the main tap can be allowed to dribble in continuously.

But if the water from the tap is still above the temperature at which development is to take place, some ice from the local fishmonger (or the refrigerator, if you have one) will be the only way to keep the temperature down.

Verticals and the Miniature By A. G. C.

PEOPLE are always grumbling about the lack of rising front on miniature cameras, but actually there is a very simple method of obtaining a degree of "rise" equal to that given by a field camera with the lens opposite the top of the plate, which is ample for most purposes.

It consists simply of using the camera "portrait way," i.e., with the longer dimension of the negative vertical, even though a horizontally proportioned building be the subject.

If the camera is held level the subject will be seen in the top half only of the view-finder, the bottom half of the negative being ignored and masked off in printing.

While it is not claimed that this is an original idea, it is a definite fact that users of modern apparatus, and particularly

35-mm. cameras, seem very loth to use their instruments other than "landscape way."

Certainly they are more comfortable and convenient to operate thus, but, after all, it is largely a matter of habit, and with a little practice they can be used perfectly successfully "portrait way," and speed of operation is not usually essential for architectural work.

The 24×36 mm. and V.P. sizes are particularly suitable, as, being long and narrow, they give halves of good proportions.

The "half" is really not so very much smaller than the whole, and verticals are perfectly corrected, even when tall buildings are photographed.

Modern Miniature Cameras

THE PILOT REFLEX.

THE Pilot is a twin-lens reflex, making 16 exposures each 3×4 cm. in size on a standard 8-exposure V.P. film. The small size of the picture leads, of course, to a small camera, and in the case of this reflex space is still further saved by making the camera fold. When closed the dimensions of the camera are $5 \times 3 \frac{1}{2} \times 2$ in. thick over all projections, while its weight is only 18 oz.

Pressure on a small button at the side of the camera releases the front, which springs forward on lazy-tongs, carrying with it the lens and shutter of the taking camera and the lens of the viewing camera. The same action automatically erects the hood. Focussing is controlled by a knob at the right of the camera, the front of which, with both lenses, moves forward as a whole on rotating the knob, which operates upon the lazy-tongs supporting the front. A dial surrounding the knob carries a focussing scale graduated to 3 ft. 3 in. The focal length of the lens fitted is in all cases 5 cm., and the taking lens may be had mounted either in a Compur or a Compur-Rapid shutter speeded to 1/500th second. Tessar lenses of aperture of either f/3.5 or f/2.8 are available.

The picture shown on the screen is horizontal, the film winding upwards in the camera. For vertical pictures the focussing screen may be viewed with the camera turned on its side, as with other reflex cameras of horizontal pattern, but there is also provided a folding optical direct-vision view-finder enabling it to be used at eye-level either vertically or horizontally. The focussing hood is equipped with a powerful magnifier for focussing, which springs out of the way by a touch on the top of the hood. The hood itself is in two parts instead of the customary four, and is in consequence easy to fold down with one hand.

Loading and Film-Advance.

The camera is very easy to load, the full spool being just dropped into place in its chamber, which is equipped with a powerful tensioning spring. The film is led across the back of the camera to the take-up spool, there being the usual plated and polished rollers at either end of the picture opening, while a pressure-plate held up by a strong spring is provided to keep the film accurately in register.

Film transport is automatic, and is controlled by a lever below the focussing knob. When the camera is first loaded this lever is moved to and fro until the number 1 appears in the red window in the back of the camera. The automatic exposure-counter is then returned to 1, and after each exposure the film is advanced ready for the next by two pressures on the lever. Besides moving the film the correct distance, this action also advances the counter.

In spite of the smallness of the picture, we found no difficulty in focussing accurately with the aid of the magnifier provided, and the sharpness of focussing seen on the screen was duly reproduced in the developed negative. From these, enlargements of any reasonable size could quite satisfactorily be made.

A tripod-bush is provided for vertical pictures, while for horizontal pictures the camera can be stood firmly on any flat surface, there being a foot below the front which provides the necessary support. A useful accessory is the neck-strap, adjustable in length and permanently attached to the camera at one end.

The Pilot, which is the only 3×4 cm. reflex camera made, can be had with f/3.5 Tessar lens at £17 10s., or with f/2.8 Tessar at £20. These prices refer to the camera with Compur-Normal shutter speeded to 1/300th sec.; with Compur-Rapid speeded to 1/500th the prices are respectively £18 15s. and £21 5s. The camera can be obtained through any dealer, or from the sole importers, Messrs. Sands Hunter & Co. Ltd., 37, Bedford Street, Strand, W.C.2.

Miniature Camera Gossip

By LANCELOT VINING.

MY first tests with the $7 \frac{1}{8}$ -in. (18-cm.) f/2.8 Sonnar are completed and may be of interest. I want to make it quite clear that the test was to find out if a lens of this focal length and aperture would be of use to me in my work; it was not an optical test in any sense. Recently I made a series of tests with the Tele-Tessar of the same focal length and aperture f/6.3, and the question to which I now wish to find the answer is, can either of these $7 \frac{1}{8}$ -in. lenses give me better general results than I can get with my $5 \frac{3}{8}$ -in. (13.5-cm.) Sonnar f/4? This lens sets a very high standard, especially when used with the new F film and No. 15 developer, a combination which seems to have no limit as to the degree of enlargement.

I attach great importance to the definition at full aperture, because with an expensive lens of this class this is what you are paying for. Then there is size and weight to be considered, and whether a tripod must be used. Space compels me to be brief, so after

Taken with $7 \frac{1}{8}$ -in. Tele-Tessar f/11, 1/200th sec.

Film Speeds.

A. E. S. (Jersey) sends me a piece of film which has been very over-exposed and over-developed, and with it he sends these particulars: Sixtus meter, Agfa F (new), Scheiner speed 23° , f/8, 1/50th, D76 for 9 min. at 65° .

If he takes the film as 23° when the makers say it is 27° , I am not surprised

at the result. Perhaps Mr. S. has been consulting a film-speed table recently published (not in "The A.P.") to which my attention has been drawn by another reader. InitF (new) is given as 23° . I regard this table as incomplete in that no mention is made as to the developer used in the laboratory tests which are the basis of the table. It is most important in miniature

Taken with $7 \frac{1}{8}$ -in. Sonnar at f/4, from Circle at Holborn Empire.

taking everything into consideration I will sum up by saying that I have decided to make my longest lens the $5 \frac{3}{8}$ -in. f/4 Sonnar, as I feel that with it I can at least equal and in some cases beat the results given by the $7 \frac{1}{8}$ -in. lenses.

I feel certain that a focal length of about 5 in. will prove to be the limit for miniature cameras without tripod.

photography to realise that the developer does alter the speed of the film.

I find all the ultra-fast films are quoted at 26° for the Sixtus, a number I usually use only when the developer contains paraphenylene-diamine. This figure would give almost hopeless over-exposure with Johnson's Fine Grain or Kodak's D76, as of course it has done in the case quoted above.

TEN GUINEAS AND UNDER

A Section for the User of the
Inexpensive Miniature.

RAINDROPS By F. N. BAKER.

LUPIN LEAVES.
1/2 sec. at f/11, Panatomic film. Dull day.

A WET day is not usually considered good weather for photography.

However, one or two strolls round the garden after some heavy showers of rain disclosed several novel pictures.

Raindrops, glittering brightly in the light like many-faceted jewels, were standing on every leaf, every twig and every petal. Sometimes, as in the picture of the rose, the drops were scattered, as if aimlessly, over the surface of the flower, accentuating the texture of the petals by the contrast of the light and dark of the multiple reflections within the drop.

On other plants, as witness the lupin leaves above, the droplets had gathered round the edges, outlining the leaves in a glittering line of light, and throwing into prominence the form of each in a way that could never happen without some such aid. Gone was the usual difficulty of outlines vanishing against a background of the same colour; each leaf stood out, clearly defined against its background by the rim of droplets along its edge.

Surely a tempting series of subjects for photography; and it seemed to me that if I could not find some pictures with the

aid of these sparkling drops then the photography of flowers and plants was not for me.

The photographs reproduced were taken with an Ikoflex II camera, which has an f/4.5 Novar lens and a fully-speeded shutter. They were taken at a distance of about 16 in., focussing at this short range being achieved with the aid of a pair of supplementary lenses.

At such close range there is very little depth of focus, and while it is necessary to obtain critical definition over the necessary portions of the picture, it is at the same time desirable to stop down as little as possible. My own method of achieving this is to focus first on the nearest point required to be sharp, and then on the farthest point, noting the distances carefully. On consulting the depth-of-focus scale I can then find the largest aperture with which objects at

IRIS.
1/20th sec. at f/8 on S.S. Pan. Very dull June day.

these two distances can be sharply rendered, and the correct distance for focussing on, this of course being somewhere between the two distances measured.

Despite this, the stop needed is often a small one, and a slow instantaneous exposure is required, so that the camera has to be supported on a tripod. I found it necessary to watch carefully for a suitable moment for exposure, as leaves or flowers are frequently in almost constant movement owing to the wind.

Incidentally, this wind, and the sun too, necessitate fairly prompt attention to the subject, for the raindrops vanish very soon after the shower is over.

I think that the best wet weather is to be found on a windless day of heavy showers alternating with brief bursts of sunshine, which causes each raindrop to sparkle like a jewel when seen at a suitable angle.

RAINDROPS ON THE ROSE.
1/25th sec. at f/8 on S.S. Pan. Dull July day.

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

FOCAL-PLANE OR COMPUR?

I contemplate buying a miniature camera, and would appreciate your remarks as to the relative merits of a focal-plane or a Compur shutter for this type of camera. A decision on this point would help considerably in narrowing for me the field of choice. F. G. (London.)

In looking through lists of miniature cameras you may have noticed that in general it is the most expensive cameras to which focal-plane shutters are fitted. The reason for this is primarily that the use of a focal-plane shutter makes it possible to exchange lenses without fogging the film.

Apart from this point, we should say that a focal-plane shutter is, on the whole, neither better nor worse than a between-lens shutter for general purposes. With the focal-plane shutter the release is always on the camera body, but this advantage, which we regard as a very great one indeed, is nowadays also available in many cases in cameras fitted with a Compur shutter. Speeds over 1/500th second offered by the focal-plane shutter are so seldom used that except for high-speed photography we do not think you would ever miss them. The slow speeds of the Compur shutter are invaluable, and if you choose a focal-plane camera we should strongly recommend you to select one on which these slow speeds are available. The only remaining advantage of the focal-plane shutter that occurs to us is that its construction allows the setting of the shutter and the winding of the film to be performed in one operation, which is obviously not possible with any between-lens shutter.

We hope that these remarks will be of assistance to you in choosing your camera.

NARROWER ANGLE OF VIEW.

I have adapted my 4.5x6 cm. ("sixteen-on") camera for cine film, and find that the new size of negative includes less of the view than did the old. Can I use some lens in conjunction with my present 3-in. lens to restore the original angle of view? If so, where and at what price can I obtain the supplementary? A. M. R. (Bournemouth.)

You will not be able to fit a different lens to your camera in order to obtain on 35-mm. film the same angle of view that you obtained on the larger film you were previously using. To do this would necessitate a complete redesign of the camera.

Your correct procedure is to mask the finder, by means either of black paper or black paint, until the field of view shown by it is reduced to that given on the small size of film. This you can do by comparison with a temporary focussing screen placed where the film normally goes.

We would add that in our opinion your new reduced angle of view is more suitable for the majority of subjects than the wider angle given by the camera as it originally stood.

HOW MANY?

Can you tell me how many square inches of normal roll film can be efficiently hardened in 16 oz. of Teitel's "Scratchproof" at normal dilution?

M. F. (Harrow.)

We regret that we have no information as to how many films can be officially treated in 16 oz. of Teitel's "Scratchproof." For this information you should apply to the makers of the preparation, who are in a much better position to answer questions of this sort than we could be.

CONVERGING VERTICALS.

I enclose two sets of small negatives, one set taken with quite a cheap lens and the other taken with a lens of the very highest grade. I am astonished to find that even with the expensive lens distortion is evident in that the upright lines of the buildings are not parallel. Is my lens a faulty one?

S. V. (Isle of Man.)

Converging verticals in a photograph are due to one thing, and one thing only. That is, to having the back of the camera not strictly vertical. The make or design of the lens has no influence whatever upon the parallelism of vertical lines.

PANATOMIC FILM.

Can you tell me the DIN speed of Kodak Panatomic film for 35-mm. cameras? I have an exposure meter marked in DIN speeds only.

F. G. S. (Yeovil.)

Messrs. Kodak Ltd. do not publish the speed of their films in this country, but in a table in a German journal we notice that 35-mm. Panatomic film is advertised as having a speed of 16/10ths DIN.

Titling an exhibition print is a more important matter than many picture makers realize, for it can control to quite a large extent the spectator's approach to the picture. This article draws attention to quite a number of points all too frequently overlooked.

TO set a good picture into circulation with a sloppy title is as bad as wrapping Ming ware in old newspapers. It's not only bad taste, but bad policy.

The caption not only can, but nowadays usually does, go a very long way to determining one's reaction to the scene. Ideally, the picture alone should tell the story, but it is very rare that circumstances and artistry so combine as to dispense entirely with words.

Their true function is to provide the context. The artist had the benefit of a myriad influences at which he cannot more than hint in the photograph. He could smell the hay. He heard the slow creaking of the wagon climbing the hill. He was deliciously aware of the wind playing in the golden sheaves. His paramount emotion was one of peace.

But his print does not show that alone. It shows harvesting and plenty and the effort of the horses climbing the hill. So the artist is very well justified in giving a lead to the observer's thoughts.

The Captious Critic.

It is a favourite trick of some critics to pick up a print, studiously ignore the caption, and ask derisively what it is supposed to represent. That type is best left alone, but if you can afford the time, persuade him to look at some illustrated newspapers with you.

Ignore the news items; their need of a caption will not be gainsaid. Choose the light relief. Here you will find quite competent but otherwise ordinary pictures of not really remarkable subjects—usually girls, children and animals. In every case it will be found that position on those expensive pages is held solely by clever captioning.

Perhaps your bully friend will hedge: "Oh, yes, but that's not Art." He really means Old Masters—not forgetting the

What Shall I Call It ?

By HEBER GHYLL.

capitals. Don't be dismayed. Artists always were and always will be the same; they have a thought to convey, and convey it they will even if they have to use all the Muses in concert.

Perhaps he thinks that "The Angelus" would be better if titled "Toil," or "The Workers," or "The End of the Day." Maybe he does, but that does not alter the fact that to Millet the scene meant "The Angelus" and nothing else. And we gain by having our thoughts directed into precisely the same channel as the master's.

Varying Interpretations.

Very often a print conveys a different message to each observer. Startling proof of this can be found by fitting captions to other people's pictures without reference to the original title. Ask your friends for their opinions. With six observers you will get six titles, all different from each other and the author's.

Besides being very good practice in titling it rams home again the fact that a picture can convey more than one thought, and if you want the observer to see it as you see it you must take the trouble to give him a

caption that will give him a lead.

So far we have treated a picture as an expression of the artist's thought. Suppose that he is not particular about that, but only asks for appreciation. For example, a would-be contributor to a paper seeks only the approval of the readers as expressed through the Editor's acceptance.

Titling for an Editor.

Here is equal need for good titling. The only difference is that the artist must try and guess the most acceptable interpretation for his market. He can be facetious or matter-of-fact. He can be informative to children or extremely allusive, not to mention elusive to the unsophisticated.

He can sell a print to one editor with a reference to "Caledonia, Stern and Wild," dispose of the same subject to another editor with a plaintive reference to the litter problem, and to yet a third drawing attention to the disgraceful condition of the road surface.

But whatever his aim there is one thing certain. Not one picture in a million cannot be improved by a good caption—and the better the better.

Too obviously posed. And she is diving out of the picture—and into what? A Sana-pit?

ALL the world loves a bather. At any rate all the photographic world, judging by the amount of celluloid spent on the species. Looking through hundreds of only too similar prints one sadly wonders why. Presumably it is due to a kind of intoxication caused by the subversive influence of unlimited sun, water and legs. The dour attributes of critical criticism and proportion are soon submerged under the general air of gaiety.

Detached Attitude Needed.

Which is all rather a pity as the subject is full of exciting possibilities. So we'll forget that we are on holiday, forget that it is the most hackneyed subject under the sun and make our

For snapshots of this sort, use a fast shutter speed and don't stint film.

Pictures of Bathers

approach as cold-bloodedly as if we were contemplating Cologne cathedral.

This being achieved, it will be unnecessary to remind ourselves that we are about to make a picture. Our eyes, un-

cult to seize the psychological moment in impromptu. Nothing unusual should be allowed to escape. Sameness is death to a bathing picture. If the surroundings have any picturesque value the utmost advantage should be taken of them.

Technical considerations demand just as much attention as ever. At the seaside it is difficult to appreciate the tremendous amount of light available. Full advantage can be taken of the faster speeds, which is all to the good when we realise how "snap" some of the "shots" are.

When a Tripod is Wanted.

On the other hand, when the scene is laid by wooded streams there is grave danger of under-exposure. However pessimistic the meter may be its advice must be taken. Action cannot be so brisk. The lively must give place to the stately. Perhaps a tripod will be required. In these days it is hardly necessary to mention a lens hood. Like soft collars they are the usual wear.

For Competition?

Having noticed that bathing pictures frequently scoop the prizes, you will perhaps enter your best effort in a competition. The reasoning is fairly sound; probably it is something to do with the deplorable taste of the public for legs. But it may have a lot to do with the fact that the huge majority of pictures submitted to competitions feature bathing. In fact "competition" is the *mot juste*, there is plenty of it.

Which means that your effort must be even more breath-taking than usual.
H. G.

If posing is necessary, at least try to make it natural.

dazzled, will weigh mass against mass, contrast this light with that shade and, in fact, do all those subtle tricks of composition to which we have trained them.

At the same time, we will remember that our scene must have a meaning. Everybody must be doing something and nobody must be interested in anything which is not shown—least of all in the photographer. Gleaming smiles are welcome. They express the lightheartedness which should grace the occasion. But they must not monopolise the picture.

Humour of the robust kind is better staged; it is very diffi-

Against-the-light effects can be good, but they can also be disappointing.

how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CDI.

Mr.

R. G. LEWIS.

From information communicated to our Special Representative.

"WHEN circumstances have permitted I have been an enthusiastic traveller, and my photographic technique (such as it is) developed out of the original desire to record my travels as efficiently as possible. In this way my work remains almost entirely concerned with landscapes, unfamiliar architecture or portraits of striking and exotic types. I like my pictures to have a certain interest value, and am not entirely satisfied by purely harmonious or rhythmic conjunctions of light and shade. The same attitude of mind predisposes me in favour of straight prints with a minimum of ordinary spotting, eschewing faking of any kind, not excluding such harmless devices as the introduction of clouds. This attitude is not based on any intellectual conception regarding the nature of photographic art, and

probably in fact boils down to little more than an inability to recover entirely from the 'souvenir snapshot' stage—but there it is!

"Originally a 'new angle' adherent I now no longer employ pictorial sensationalism for its own sake, but have a sneaking preference for the unusual viewpoint when this can be introduced with propriety. Actual details like the process employed or the method of mounting I do not hold to be of much account. Even art is not immune from the oscillations of fashion. I have been at one time or another an enthusiastic addict of almost every known process in the production of my enlargements. At the moment the Puritan element is uppermost, and I produce large numbers of highly glazed bromide prints, demanding from each the very maximum of detail.

"Having, however, turned out some 2,000 of these following a short trip to Arabia, a reaction in favour of some more subdued finish is probably just round the corner. On the whole I am inclined to think that a bold and striking subject is best rendered by the employment of the least intrusive medium. The faded and nostalgic charm of bromoil transfers, etc., savours too strongly of the nineteenth century for my taste.

"At present I use a Leica or a Contax for practically all my work. A Rolleiflex and a Super Ikonta serve for auxiliary purposes, being preferred for dealing with landscapes of the panoramic variety. I am of the opinion that eventually 24 x 36 mm. will become the standard negative size.

"As I usually enlarge my most successful pictures to 24 x 20, I habitually develop my films in some form of paraphenylene developer. Recently I have adopted for standard use Champlin 15, which, while sharing the favourable attributes of the paraphenylene-metol formula, produces an even finer grained negative.

"Sometimes when taking a series of landscapes in sunshine I use a very fine grained slow orthochromatic film such as Perutz fine-grain special, and develop this in the original Sease 1 developer, which in this case does not exercise its notorious and fatal slowing-up propensities. The results from the point of view of grain are absolutely fantastic, and have allowed me in the past to make several almost grainless 6-ft. enlargements. Apart from the grain, however, the soft-working developer has a counteracting effect on the extremely contrasty orthochromatic film, producing a beautifully graded enlarging negative. I strongly recommend this tip to all miniature camera users."

(A further example of Mr. Lewis's work is reproduced on one of the centre Art pages.)

AN EASTERN MILL.

R. G. Lewis.

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"THE REAPER," by G. B. P. Sturrock.

INASMUCH as this is a piece of work that seems intended to be regarded as an outdoor portrait, there are points of resemblance between it and "Sunbather," which was discussed in these columns in our issue for the 18th of last month. Both examples show a figure in strong light against an even-toned background; in both the arrangement is simple and accessories are few; and both, from different points of view, present an undoubted appeal.

Here, the model is shown in a pose that well reveals the attractiveness of her features; the composition leaves nothing to be desired, for the head is well placed and spaced and the accessories not unduly assertive; and the setting is unobtrusive and admirably calculated to display the head to advantage. Yet, in spite of all these qualities, I find myself preferring the other, and feel that there is something not altogether congruous about the impression. On reflection, I am inclined to think that my feeling is attributable partly to the fact that this subject appears to have been posed and seems to show it; partly because the roundness of the features is not as well suggested in this instance as in the other; and partly on account of the fact that there seems to be something a bit suspicious about the lighting—the angle at which it is falling.

My assumption that the model is posed rests mainly on the fact that I do not think that anyone actually engaged in gleaning or reaping would naturally adopt the attitude in which she is shown while on the job. Her expression suggests abstraction, and she neither seems to be looking for more strands to glean nor attending to those she already has. Moreover, the way the sheaf is held is not in accordance with the way it would ordinarily be carried, which would be along the line of the forearm, more in a horizontal direction, and across the body, pointing slightly upward.

With the sheaf held as it is, the feeling is that it has been carefully disposed that way for its decorative effect, for, with the existing margins, a sheaf, carried in the normal way, would only cut across the bottom left-hand corner, where, as far as effect is concerned, it would be negligible. The same feeling of deliberate arrangement extends to the upright stalks and ears on the right, for not only are they without the natural background

this, for one thing, places the picture at a considerable disadvantage in comparison with "Sunbather."

The loss of modelling in the features is attributable to the direction in which the light is falling. The model is practically facing the source of light, which seems to be coming from the right in a direction that is *almost level*. This is indicated by the fact that there is no shadow cast downwards by the nose, and by the streak of light

that passes across the base of the neck. The occasions, in this country, when strong sunlight falls—or, rather, shines—at such an angle are extremely rare, and only at sunrise or just before sunset could it be expected. It presupposes, too, that the subject was on an eminence with an uninterrupted view of the horizon, facts which, taken in conjunction, lead to the conclusion either that the subject has been twisted round a bit in a clockwise direction, which would make the light source seem lower than it was, or that the lighting was not sunlight but artificial (!).

Now, if the light were sunlight, the sheaf on the right would either be wholly in shadow, or, if it were in light, its lights and shadows would be almost if not quite as strong as those on the left. But they are not, and the inference is that the light was artificial, and that the beam was not wide enough to cover both, or that it was intentionally prevented from exercising its influence on the elements in question.

So that it would seem that we have a subject taken by artificial light masquerading as an outdoor study, and, having regard to this disclosure, it can scarcely be viewed as succeeding in its intentions. It is clever, no doubt, and shows a considerable amount of ingenuity, but if my deductions are correct—and I expect them to be challenged if they are not—the thing is a fake, and fails to succeed because its contrivance is penetrable.

"MENTOR."

they would have if they were actually growing, but they fade away at the base in a fashion that suggests an interference with the photographic image and an attempt to disguise something that might tend to afford a clue to the artificiality of their placing.

On these grounds, the fact of posing seems to be pretty well established, but that, in itself, might not be so serious were it not the obvious intention to present the subject as an unposed and spontaneous impression. That posing is disclosed utterly destroys the feeling of spontaneity, and

PICTURES by Novices

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page.

THE worst of knowing a bit about photography—and I suppose I must have picked up something since I started somewhere about 1910—is that it is inclined to make me critical and not disposed to take things at their face value or assume that they are altogether what they seem.

The Critical Eye.

Were it not for this, and the times I have seen the beginner light-heartedly tilt his camera upwards, I might be disposed to pass over the way the verticals converge towards the top in No. 1 of the prints on the opposite page—"Straight into the Sky," by B. M. Crayston—and regard it as a somewhat uncommon phenomenon, curious, perhaps, but not entirely unacceptable.

Viewing the print from the critical standpoint, however, I feel, at once, that the novice has been up to his old game and has sinned either intentionally or in ignorance of what might be expected. As it happens, the effect is not of very great moment in a subject of this kind, although, to some extent, it conflicts with the implication of the title, but if buildings were concerned, the result might be very distasteful and convey the impression of a backward inclination.

In other respects, the print is good, and does, at least, present an adequate rendering of the nicely clouded sky, a feature in which No. 2, "Shady Arch," by Edward Cross, is noticeably deficient. Nor is the vista seen through the archway of sufficient attraction to acquire a pictorial value, and it certainly does not warrant the emphasis which the framing effect of the arch accords.

On the other hand, good use has been made of the foreground shadow, which admirably leads up to the middle distance and beyond, so that it is a pity that these features are so disappointing.

Shadowed Foregrounds.

A shadowed foreground, such as this, is very often a useful adjunct, for not only does it give a picture stability, but it tends to direct the attention to the more attractive elements farther in.

Possibly this is the reason why so extended a foreground has been included in No. 3, "The Cobbled Street,"

by E. W. Forster; but this is overdoing it, and where the interest lies so much more "in" the picture—in the figure, to be precise—there is not the same necessity for the shadow across the base, providing, of course, that the general tone of the foreground is not assertive.

And it isn't in this instance. The roadway, although in sunshine, has appreciably more depth of tone than either the figure or the whitewashed cottage adjoining. The foreground is strong enough without the shadow, and, in the circumstances, I think I would trim about three-quarters of an inch from the base, as well as a quarter of an inch from the left to keep the picture proportions about the same.

With No. 4, "Bibury," by T. Winney, the disadvantage of an assertive foreground is demonstrated. The main interest should attach to the gable end of the cottage on the left in sunshine, but, with the strong lights of the stream below and their contrast with the dark of the path, a sort of double attraction arises neither of which is forceful enough to predominate.

Unity of Interest.

Cover up the lights of the stream and the value of the light on the cottage is immediately apparent. The interest, instead of being dispersed, is unified, and the composition is rendered acceptable. Reference back to No. 2, where the vista is wholly in light and there is no other of consequence to compete, illustrates the value of unity, for, while the lack of appeal in its make-up is to be deplored, there is no doubt whatever that that vista forms the centre of attraction.

The very light tone of the sky, too, is inclined to create another source of distraction, but not so serious as the lights of the stream, and, in a case like this, where there is no particular reason for retaining the sky, it might as well be removed.

The result of this expedient is exemplified in No. 5, "A Quiet Ramble," by F. W. Taylor, even if there be just a spot of light at the top towards the left. Personally, I should trim this away with the idea of concentrating the attraction more effectively on the figures, for nothing vital

to the picture is sacrificed and the gain in unity is appreciable.

Pulling Together.

The figures, in this instance, do tend to pull the composition together. In their absence, and as happens in almost every case where one side only of a street is shown, there would be a regrettable tendency for the interest to follow the lines of perspective out of the picture. This can only be countered by the inclusion of a strong centre of interest, a purpose which here is fulfilled by the figures, but even this is not so satisfactory as the stop which is provided when a small portion of the other side of the street intervenes.

No. 8, "A Corner of Polperro," by R. Arthur, illustrates the point. Here, the part of the building on the right prevents any tendency towards running out on that side, although, strictly speaking, the tendency would not be nearly so strong in this case, because the perspective lines would not extend so far as to reach the right-hand side, for they come to an end before they get anywhere near it.

The scale of the figure, which also tends to unify the arrangement, is a trifle on the large side, and I think the photographer would have been better advised to have deferred his exposure until just after she had reached the top of the steps.

Spacing and Placing.

Besides avoiding a certain confusion which exists on account of the conjunction of the head with the shadow of a window embrasure, the figure would be more effectively isolated if she were advanced a bit, and her placing in the picture space would also be greatly improved.

In No. 7, "In an Indian Village," by J. B. Kearney, the figures, unfortunately, are somewhat lost against the similar tone of their setting, and the very light toned notes on the walls and surrounding the doorway form disturbing items of attraction which are inclined to disperse the interest yet further. A much better degree of concentration exists in No. 6, "Severn Bridge," by D. G. Turner, the houses and bridge in sunshine providing an effective centre of interest, while the rendering of the sky is excellent. "MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE
LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

MORE ABOUT SPOTTING.

LAST week I spoke about the necessity of eliminating white spots on prints, and described a simple way of doing it. At the time I referred only to the kind of spots often called pinholes, and included those caused by touching out with opaque medium clear spots on the negative.

I would remind you now that this spotting should be extended to other spots and patches on the print that are not due to mechanical defects, but arise in the subject itself. Bright patches and even small light spots are apt to give a restless and fussy effect; they are irritating. It does not follow that they should all be taken out; they may be a natural feature of the subject; but very often

some of them may be obliterated altogether, some more or less toned down, and some left as they are. Generally this modification is most necessary near the edges and in the corners, because these are just the parts of the print to which the eye should not be drawn.

The duck subjects were taken to illustrate the point, and not for their pictorial value. On the ground near the pond, and on the water, were considerable numbers of white feathers, very obvious in a large print. These were merely accidental, as it were, and there is no reason why they should not be cleared up.

As Fig. 2 was taken at rather closer quarters, they were still more irritating, and it will be seen that I have removed

Fig. 1.

Fig. 2.

them up to the immediate foreground. Here they were not so numerous, and I should leave the stones and other patches as characteristic. The rest of the ground has been made to appear just as it would be but for the feathers.

I should not do anything to the spotty leaves in Fig. 3; they are a natural feature. As a matter of fact I have included this only as an excuse for referring to an entirely different kind of "spotting," even more important than the mechanical variety. This is the art of spotting the best way of making a record photograph serve its purpose.

At Greensted, near Ongar, in Essex, is a little church that has been photographed thousands of times, and nearly always the whole building is included. But the building was originally a temporary shrine of roughly hewn tree trunks built in 1013 to shelter the body of King Edmund on its journey from London to Bury.

In the print these timbers can be seen on each side of the porch, which with the dormer windows and the rest of the little nave is comparatively modern. On the right is a small chancel of red brick, and on the left a wooden

Fig. 3.

tower. I show it as a modest example of "spotting" the essentials of the subject and omitting or suggesting the rest. It is fatally easy to include too much.

W. L. F. W.

"THE A.P." *Special Competition for Novices*

THIS competition is specially for Novices, that is to say, those amateur photographers who have never won an award of any description in a photographic competition, and preferably those who are only just starting photography.

The prizes will be awarded for the best snapshots of subjects that the beginner usually attempts. These include snapshots of the family, groups or single figures taken at home or on holiday, either indoors or outdoors, and landscape and beach scenes, etc., with figures. The arrangement of the subject and the pose of the figure or groups is a matter left entirely to the discretion of the competitor.

The entries will be restricted to contact prints and enlargements of standard "Enprint" size, which do not exceed $4\frac{1}{2} \times 3\frac{1}{2}$ in., even if made from the whole negative. These may be mounted if preferred, and the smallness of any print will not affect its careful consideration in this competition. The rules are very simple, but should be read carefully.

THE PRIZES.

The prizes in this competition will consist of supplies of roll film or plates (for those winners who happen to use a plate camera), as follows:—

The First Prize will be TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.

The Second Prize will be TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.

The Third Prize will be ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.

Twelve Prizes of ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

RULES.

Each print must have affixed firmly to the back a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor. The latest date for receiving entries is September 30th.

The copyright of all prints entered remains the property of the authors of the photographs, but the right is reserved by "The A.P." to reproduce the winning prints and any others that may be worthy of mention. The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed to: The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices' Competition."

MAKING BETTER SNAPSHOTS-13

By DAVID CHARLES.

This article is the thirteenth of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

Fig. 1. The pattern of light and shade, combined with careful placing of the sitter against it, makes even this background satisfactory.

ON most occasions the breaking of a rule only wastes film, but at times such a breach may be a positively laudable act. It may, in short, be the means of producing something entirely novel. Some weeks ago I had something to say about unsuitable backgrounds, and of all the portrait backgrounds which have come down in photographic tradition as unsuitable, a brick wall stands as the supremely absurd example. Yet in my first illustration the background is a brick wall, and I venture to predict that few people will dislike this deliberate departure from a rule which is as old as photography itself.

Extenuating Circumstances.

But the attractiveness of this result is due to the fact that the photographer first noticed the pattern of light and shade falling across it, and then deliberately experimented with posing his small sitter against that effect. It will be noticed that the profile falls against the wide stripe of shadow by contrast with which it "shows up" clearly. The already rather dark hair is softened by running into the diagonal stripe of the shadow pattern. The brickwork, instead of being objectionable, serves to show up the stripe pattern thrown by light in a way that no background not having a texture and structure of its own could possibly do.

The arrangement of this "sitter" in

Fig. 2. An even more unorthodox background than that of Fig. 1. But it is well out of focus, and the worst fault is not the background at all, but the supporting arm.

this scheme of light and shade was obviously deliberate, and was carefully done with the definite intention of securing the result seen. That is why it has "come off."

A Map and a Mother.

I very much doubt, however, whether anyone would deliberately select a combination of a mother and a map as a background for a baby's portrait. But if a baby is found in a good and photo-

Fig. 4. Seen from this angle, the door of a car makes no kind of a frame for a portrait.

graphable mood, even against so unusual a background, there is a fair chance of securing something at the same time pleasing and unconventional, especially if the lens used is a fairly rapid one which will throw the background out of focus even though only a matter of inches behind the subject. The worst fault is that the arm holding the child is both sharply defined and

Fig. 3. Delicate shading and fluffy hair need a simple softly-graded background to show them up. Against this sort of thing they are quite lost.

exaggerated in size by its nearness.

In taking the charming little girl in No. 3, the photographer probably thought the background of dark trees would show up her fair hair. He should have chosen a spot where the sunlight would be on her fair hair and off those trees. Then they would have had the desired effect, especially if he had selected trees without those bare openings.

Spontaneity.

The window of a car is not the best of backgrounds for child portraiture, as can be seen by Fig. 4. But if the camera is held more at an angle to the car so as to show it is a car, and then the child is persuaded to talk about something or other, sooner or later he will probably assume a good pose and a good "expression" simultaneously.

Fig. 5. Taken this way, so getting rid of the vast area of blankness, the background—or surround—is quite effective. And suitable conversation has evoked a pleasing smile.

Architectural Detail *and the* Telephoto Lens

By A. H. COLLINS.

IF the reader should have a half- or quarter-plate camera with a long extension, and is interested in architectural details of any period, here is a fascinating subject for his skill.

A wide-angle lens is seldom necessary, except in a confined situation. But a lens of average focal length, say 8 in. or thereabouts on a half-plate, will be useful for a far larger number of subjects. Besides these two I always carry also two other lenses—a telephoto lens of 17-in. focus and another of much higher power, though of variable focus. The latter lens is ordinarily used at an extension which gives an effective focal length of 45 in.

The Most Useful Lens.

The 17-in. lens is perhaps most used. With it the perspective of small subjects, such as door knockers, will be better rendered than if they are taken with an ordinary lens; for as the camera can be considerably farther away from the subject the details that project most will not be exaggerated in size as compared with the details which lie farther back.

If the subject, again, is rather above the line of vision, the use of an ordinary lens will involve a considerable amount of rising front; while with a telephoto lens on the camera placed a greater distance away, the details will be more nearly level with the eyes, and will also appear larger in the photograph. Incidentally, a good telephoto lens admits of a considerable amount of rising front being used.

I have found other occasions when it is well to get some distance away; as, for instance, in photographing the west doorway of Dunfermline Abbey in Scotland. Either I had to make a nuisance of myself and stand out in the middle of the public road, or I could

LEOMINSTER PRIORY.
Detail of West Doorway.

greatest extension which admits of the rising front being well employed, which in my own case gives a focal length of some 45 to 50 in. Focussing is done on the lens itself by varying the separation of the front and back components. If the details required are in different planes this is not easy, as the depth of focus is practically *nil*. Hence it is an advantage to employ the smallest stop of all for exposure.

The eyes soon get tired if they are long raised to examine details above their level. The 50-in. lens is particularly valuable for taking a doorway or corbel table section by section so that every detail may be studied at leisure.

With both types of telephoto lenses the user will find that a slight tilt of the camera matters very little, owing to their peculiar construction, and probably it is better not to compensate at all by the use of swing back or swing front, unless the amount of tilt is altogether unusual.

DUNFERMLINE ABBEY. West Doorway.

retire to the pavement beyond, focus the doorway at leisure, and make the exposure as the traffic allowed. From the middle of the road, also, the gateposts in front of the Norman doorway would have appeared uncomfortably large.

It needs emphasising that these telephoto lenses have little depth of focus, and therefore it is safer to stop them down; I generally use $f/22$ or even $f/32$, reserving the full aperture for focussing.

Variable focus lenses, such as the "Adon," are of much higher magnification; the greater the extension, the greater the focal length, and consequently the larger the detail. I have found it best to use the camera at the

The Photography of Cut Flowers

By BLANCHE HENREY.

THE photography of cut flowers can be a most fascinating pastime for the amateur, and beautiful pictures may be obtained. There is no wind to bother about, which is usually the trouble when photographing flowers growing in the open, and plenty of time may be spent on arrangement and background.

A few years ago it was difficult to make a faithful record of our favourite flowers by photography, but now that

on which the image may be focussed.

An exposure meter should be used whenever possible as the best results are only obtained with correct timing. The exposures may vary from a second or two to half a minute or more according to the lighting, speed of plate or film, colour of the subject, stop, and whether a colour filter is used.

Considerable care should be taken in the arrangement of the flowers, because this plays such an important part in the attractive character of the picture. It is a good plan when starting this branch of photography to begin with large subjects, used singly or in twos, as it is easier to get a more pleasing composition with these than in the case of small flowers. Dahlias are very easy to deal with, as

also are roses and some of the flowering shrubs. If smaller flowers are chosen, it is best to take several, arranging them in a pleasing group.

The flowers must be held as firmly as possible, and it is a good plan to push the stalks into some damp sand contained in an old jam jar or into a large potato in which holes have been bored. If either of these methods is used it affords a certain amount of moisture to keep the flowers fresh. Needless to say, the support or holder should not be shown in the photograph.

colour-sensitive negative material is so easily obtainable the matter becomes very simple. Equally good results can be secured from the palest colour to the deepest red.

Any camera may be used for this work, but a tripod is essential. It is only by means of the latter that absolute rigidity of the camera is obtained during exposure. When photographing cut flowers the exposure is usually rather long because, unless the lens is well stopped down, it is not possible to obtain the necessary depth of field and sharp results.

Although many amateurs use an ordinary folding camera for this work, perhaps the most satisfactory is an old-fashioned stand camera, which has many movements to help in the obtaining of sharpness of definition; there is also a ground-glass screen,

"Nigella" (Love in the Mist).

Perpetual Flowering Carnations
"Mrs. C. W. Ward."

Annual Chrysanthemum "Morning Star."

Good lighting plays an important part, daylight giving softer results than artificial light, but either may be used. In the former case the subject is best placed at an angle of 45 degrees with the window, and if the sun is too strong a piece of tissue paper or muslin may be stretched across the window. The shadow side of the group can be softened by means of a reflector consisting of a piece of white blotting-paper, or a mirror. Almost any form of artificial light may be used, but if a high-power lamp is employed do not place it too close to the flowers or the heat may cause them to wilt.

Helianthus "Soleil d'Or."

The two subjects on this page show the difference obtainable by choice of dark or light background.

The background must vary according to the subject, and if the flowers are dark a sheet of white or grey paper is good, and if they are light a sheet of brown paper makes a suitable contrast. If the walls of the room are

self-coloured they will often provide all that is necessary.

Orthochromatic plates or films can be used, except in the case of red subjects when panchromatic are necessary. A filter is of value at times to render the range of tones correctly, but it will considerably increase the time of exposure. This, however, does not matter in the case of cut flowers.

Thought must be spent on exposure and development. A full exposure should be given to obtain all the detail of beautiful texture, and in the case of great contrasts such as white flowers with very dark leaves the time of development must be considerably cut down.

It is particularly important to have a print which is bright and showing full detail; for this purpose the best kind of paper is one having not too matt a surface. Glossy and velvet are both excellent.

It is interesting to make a series, and, in this case, it is much more useful and attractive to mount the prints on thick white paper of standard size. Dry mounting is best for the purpose. The sheets should be kept in loose-leaf files. As the collection grows separate files may be used for

Dahlia "Glorious."

A further example of Miss Henvey's work is reproduced on a centre Art page.

different sections, such as wild and garden flowers, berries and flowering shrubs. If the name is written underneath the photograph in black ink the use of the files for reference and interest is greatly increased.

COMBINATION PRINTS BY COPYING

A.—A satisfactory result, if only the child had not moved during the exposure.

stitute the head of the child from B.

An enlargement of A was therefore made on glossy bromide paper. When this was finished and dried it was placed on the easel, the negative of B was placed in the enlarger, and the image was adjusted to the right size to cover up the head in the enlargement already made.

This was then removed from the easel and an enlargement of the

B.—Here the child is good, but the central figure staring at the camera is not.

COPYING can be usefully applied when it is desired to incorporate in a photograph some feature from another photograph. The accompanying photographs do, I think, illustrate this admirably.

Several photographs of a group were taken, and on inspecting the two best it was found that the pose and expressions of the two adults in A were preferred, but it will be seen that the child has moved during the exposure, and it was therefore decided to try to sub-

C.—The combined result is a very great improvement on either A or B.

head made. This enlargement of the head of the child was cut out and stuck on to A, covering up the original blurred head. The composite print was then photographed, with the result seen in C. Whatever its shortcomings may be, there can, I think, be no doubt that it is at least more nearly successful than either of the photographs from which it was built up.

It should be borne in mind that whilst process plates are usually advised for copying, faster plates will serve. P. OLIVER.

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

The Never-Finished Film By D. CHARLES OTTLEY.

NO matter how many films the amateur may attempt from the time he becomes the owner of a ciné camera there is one that he will never complete, one that will come to be known as an "unfinished symphony" of the years that pass.

A Diary on Celluloid.

For want of a better title this film has come to be known as the "domestic reel," and from time to time receives a good deal of attention in the many textbooks devoted to amateur cinematography. As its name implies, the domestic film constitutes a diary in animation, a record of things that happen, of places visited, of friends who come and go and of babies who all too quickly grow big. It is generally a film devoted to the aims and idealism of a universal Peter Pan, but only the film remains loyal to its trust, for although it most certainly grows *big* it never grows *up*.

Its appeal cannot be denied, and its value does not depreciate but rather increases with the passing of time. Unlike any other film, it does not depend for its appeal upon perfect photography, originality of plot or any of the miscellany of "attributes" possessed by and expected of other films. The essential aspect of the family reel is that it shall record faithfully, in a series of unposed, unsteretyped pictures, the characteristics of ourselves and those about us whose lives are intermingled with our own. Despite much cautionary advice, the unrehearsed reel is likely to give better results and certainly a more satisfying reconstruction than can ever be achieved by painstaking direction or over-studious shooting.

Unrehearsed Effects.

Much that happens in the nursery happens only *once*, and for this reason the best advice that can be given to the fond parent bent on transferring to celluloid the smiles and tears of his first-born is to keep the ciné camera loaded and in a place safe but accessible. Whether the film will interest others as it interests us is a consideration that should not be allowed to enter the conscious mind while shooting. Frequent warning is given that it will certainly *not* do so, although it is hard to imagine that the antics of a toddler first entering the vast stage of life can fail to be universal in appeal.

Possibly the adult section of the family reel, that section introducing the various aunts, uncles, nephews and nieces, etc., is likely to become mono-

tonous to those outside the immediate circle and for no other reason than that the subjects of the shots are themselves acutely camera-conscious in much the same way that we who shoot the film are apt to be footage-conscious. But in a family film shortcomings such as these are forgiven.

Those there are who decry the care-free, haphazard method of shooting which none the less contributes so much to a spontaneous record of ourselves and our home. A scenario is recommended and at least one rehearsal. One rehearsal perhaps of the more formal sequences, but how can one ever put into scenario form all the things that baby is likely to do in that delightfully unconcerned way that in itself constitutes half the interest of the shot?

Our own Private Film.

All that can be recommended is care in the cutting stage, but even here there is much irrelevant material that we shall be tempted to include and the justification for it must surely be that it is *our* film and not everybody's. Every

family has its jokes, which, though meaningless or even stupid to outsiders, never fail to raise the right response when produced at an appropriate moment in the family circle. The family film should be just like that: great fun to those immediately concerned in its making.

Richer with the Years.

It cannot be denied that the never-finished film has been responsible for more amateurs taking up a hobby that would never have been begun than any other of the many tempting things that sub-standard cinematography has to offer. Associated with the family reel is that strong parental urge to preserve at all costs those fleeting nursery memories that before we know where we are pass from us. The family film, despite all its shortcomings in the technical sense (and without them it would scarcely be a family film at all) is like old wine, growing richer with the years. Unlike old wine, however, it can never be drained to its dregs or contained on a single reel, for it grows in length as well as in interest.

In a film intended for the family circle only, such subjects as this appeal for personal reasons. But if well enough done, they may well find a place in a film addressed to a wider public.

Don't Include too Much

THERE is a very great tendency for beginners in cinematography to try and include too much in one reel of film. For instance, you cannot expect to go to a regatta and come back with a film featuring every boat and practically every person taking part. The result of such a film is not nearly so satisfactory as a few shots of some particular race or someone actually competing in an amusing event.

Trying to include too much is just as much a mistake when the phrase is applied to the field of view as when used with reference to the length of the film. In nearly every case the impression of

a large canvas can be very much better conveyed by a series of shots, each one including only some small part of the whole, than by a less intimate view that covers a large number of activities simultaneously. A short, even a very short shot of this kind, as an introduction, is useful as a mental background against which to place the individual details, but greater use of it than this is inclined to induce boredom rather than interest.

Cinematographers have an advantage over their colleagues of the still cameras in the fact that the lenses normally fitted to ciné cameras include a narrower

angle of view. This results, almost automatically, in just the kind of concentration of interest that we have been discussing. And there are long-focus lenses in reserve for still greater concentration.

We are always up against the fact that most of the friends who see our pictures at home are regular film fans, and it is only natural that our results should be continually compared with those seen on the professional screen, and from this point of view it is most essential for the amateur to pack his pictures as full of interest as he can.

G. F. H.

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Wednesday, September 1st.

Blackpool and Fylde P.S. Over Wyre.
Solihull P.S. "The After-Treatment of Negatives."

Thursday, September 2nd.

Aston P.S. Monthly Meeting.
Kinning Park Co-op. C.C. Suggestions for Winter Syllabus.
North Middlesex P.S. Competitions.

Saturday, September 4th.

Accrington C.C. Ribchester to Knowl Green.
Bath P.S. Bathampton and Invitation to I-Kaya for Tea.
Bristol P.S. Pensford.
Hackney P.S. Outing to Box Hill.
Hanley P.S. Moddershall. W. A. E. Burrow.
Harpenden & D.P. & C.S. London Docks.
Hull P.S. Little Weighton to South Cave.
Kinning Park Co-op. C.C. Lugton.
Letchworth C.C. Ashwell. Val Mitchell.
Liverpool A.P.A. Chester.
Partick C.C. Glenfruin. E. W. Atkins.
Sheffield P.S. York. Joint Outing with York P.S.
Singer C.C. Bridge of Weir. J. Crowther.
Stockport P.S. Lyme Park and Higher Disley. W. J. Parry.
York P.S. York—Joint Excursion with Sheffield Society.

Sunday, September 5th.

Bournemouth C.C. All-day Outing to Cheddar Gorge and Caves.
Harrogate P.S. Blubberhouses and Thornthwaite Bridge. G. Wells.
North Middlesex P.S. Outing to Oxford. R. T. Welsh.

Hackney P.S. "Flowers as they Grow." Slide Competition.
Manchester A.P.S. "Art and Photography."

Wednesday, September 8th.

Luton and D.C.C. Meeting.
Partick C.C. Receiving Date for Prints for Criticism.
Worthing C.C. Outing to North Lancing and Steyning.

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

PERFORMANCE OF CHEAP CAMERAS.

SIR,—I would like to thank Mr. Spiers-Purdon for his valuable letter in the August 18th issue. My experience is not so extensive as his, but has been expensive in buying five cameras in a few years all suffering from lack of a final test to ensure agreement between the true focus and the distance scale or range-finder.

The popularity of the 16-on size with $f/2.9$ or $f/3.5$ lens shows how many of us there are who want a miniature larger than the ciné film size. But we expect it to give a sharp picture at full aperture, and I ask if this is possible. Suppose the lens is one of 3-in. length at $f/2.9$, and one wants to enlarge up to three diameters, surely not an unreasonable demand.

If the enlargements are to be sharp, i.e., with circle of confusion of $1/1000$ in. diameter, the negative must have a corresponding circle of not more than $1/3000$ in. The diagram attached then shows the position. The stop diameter will be $3 \div 2.9 = 1.034$ in. Suppose the lens is focussed on an object which makes the actual extension = 3.1 in., x is the distance the film is displaced to produce circle of confusion of $1/3000$ in. By similar triangles, $x : 1/3000 :: 3.1 : 1.034$, whence $x = .01$ in.

We thus have the disquieting conclusion that every point of the film must be accurately placed to within $1/1000$ in. to allow of 3-diameter enlargements at full aperture. In many cameras, the front is not even rigid to within this tolerance. Furthermore, even the Zeiss Ikon Co. cannot guarantee this performance with their $2\frac{1}{4}$ -in. square Super Ikonta with $f/2.8$ lens, because, as they say, "no film which has a backing paper can be made to lie mathematically flat."

"THE SUNBATHER."

SIR,—Surely "Mentor" had been overcome by the heat when he wrote the criticism (or, rather, eulogy) of "Sunbather" in a recent "A.P."? He praises the picture especially for its spontaneity, and apparently overlooks two very important points, both so obvious that they were instantly seized upon by my non-photographic friends. The first is the prominent mark across the girl's body just beneath the level of the breasts; I suggest that this was left by the elastic of her brassiere, and the obvious inference, if not the correct one, is that she had just undressed specially for the picture. The second point is that the smile is exactly of that kind which some girls find quite easy to hold for hours! So the whole basis on which the picture was praised disappears.

But why this worship of spontaneity, in any case? Is it not a false standard, as we can very easily see if we try to apply it to really great art. Or are we afraid of applying true artistic standards to "mere photographs"?

I must apologise for taking up so much of your valuable space; in the normal course, I should not have taken the trouble to protest, but "Mentor" is mentor to so many budding pictorialists that I feel that some correction is called for. May I add that usually I find in his writings each week plenty of cause for praise, and little for blame.—Yours, etc.,

FRANK C. PALMER.

FILM-WINDING PROBLEMS.

SIR,—On reading Mr. F. E. Thomas's article on "Making Sure of the Twelfth Picture" in "The A.P." of August 18th, I thought that my own similar experience with a 520 Ikonta might help others in dealing with this problem.

That Mr. Thomas's remedy is effectual I do not doubt, but I do say that his diagnosis of the cause is either wholly or partially at fault, since spool diameter cannot possibly affect the placing of negatives in the case of a non-automatic film wind, and I have had a similar difficulty with such a wind.

When using Kodak film in my Ikonta I find it necessary to use the first or second dot instead of the number as a guide, in order to ensure the full sixteen exposures on the spool, whereas by winding to the tip of the pointing finger and thereafter using the numbers, I can easily get seventeen on a Selo spool. I do not agree with Mr. Thomas that the Kodak 120 film is as long as other makes; it is certainly at least two inches shorter than Selo, and probably Agfa and Zeiss Ikon also. The explanation is this: the Kodak backing paper is printed

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

A Competition and Exhibition open to all members of the Cyclists' Touring Club residing in the Metropolitan District will be held at the Club Offices, 3, Craven Hill, W.2, on October 28th, 29th and 30th. There will be two classes: (a) open to those whose work has been executed entirely by themselves (contact prints or enlargements), and (b) open to those whose work has been done wholly or partially by a professional. In each class there will be two sections: 1, Pictorial; and 2, Club Life. Any number of prints may be entered and an entry fee of 3d. is charged for each print. The closing date for entries is September 30th, and further particulars may be obtained from the Club Offices at the above address.

"Aids to Photography," the latest price list issued by Messrs. Peeling and Van Neck Ltd., 4/6, Holborn Circus, E.C.1, contains full particulars and prices of their most up-to-date tripods. This, and other price lists of cameras and accessories, may be obtained on application to Messrs. Peeling & Van Neck Ltd., at the above address.

Stolen on the 14th August from the car of Mr. T. J. Brooksbank, a 530 Zeiss Super Ikonta No. 21146, Zeiss Tessar f/4.5 lens No. 1678753, in an ever-ready case. If any reader can assist in tracing the missing camera will he kindly communicate with Mr. Brooksbank, Trefula, St. Day, Redruth, Cornwall.

While on a walking tour in Somerset, one of our readers, Mr. C. G. Taft, 67, Princes Street, Derby, lost his camera, a Zeiss Ikon Nettar $2\frac{1}{2} \times 3\frac{1}{4}$, f/4.5, with Telma shutter, delayed action, in leather case. The name and address as above were written inside the camera back in white ink. The camera was lost on Wednesday afternoon, August 4th, in the country direct between Priddy Church and Priddy Pool, Somerset. If any reader can assist in tracing the camera will he please communicate with Mr. Taft at the above address. Mr. Taft informs us that he is offering a reward to any person producing the camera.

A new photo-electric exposure meter, the "Excelsior," has just been introduced by Messrs. Ensign, Ltd. Complete in its ever-ready case, its dimensions are $3 \times 2\frac{1}{2} \times 1\frac{1}{2}$ in., which makes it small enough to carry conveniently in the pocket. The photo-cell is set back in the case, which is of black moulded material, and is inclined downwards to prevent it from "seeing" too much sky and so giving misleading readings. The calculator, operated by turning a single ring, surrounds the indicating meter, and in consequence is large and easy to read and handle. In use, the light-value shown is set against the film-speed,

when the exposure for any stop from f/1.4 to f/22 can be read off immediately without the use of tables or any further movement of the calculator. The meter is sensitive, giving direct readings in a light feeble enough to require an exposure of $1/5$ th of a second at f/2, with an ultra-fast film. For still dimmer lights a special scale is provided, in connection with which the meter is pointed at the source of light instead of the subject, and this multiplies the sensitivity some twenty times. Another special scale is provided for the cine-camera user. On comparing it with a well-tried meter the characteristics of which are known, we found that the "Excelsior" indicated, on both an indoor and an outdoor test, almost the exact exposure that the indications of the "standard" meter would have led us to give, and we should, therefore, have no hesitation in following implicitly the indications given by the "Excelsior." This new meter, which is priced at 57s. 6d., including the leather ever-ready case, can be obtained through all dealers or direct from Messrs. Ensign, Ltd., 88, High Holborn, W.C.1.

The Forty-Eighth Annual International Exhibition of the Rotherham Photographic Society will be held in the Parish Church Hall, Moorgate, Rotherham, from the 12th to the 16th

October, 1937. There are six open classes: Prints: A, Landscape and Seascape; B, Portraits, Figure Studies and Still Life; C, Natural History, Scientific and Technical; D, Architectural and Record; E, Lantern Slides (Monochrome or Colour), Pictorial; F, Lantern Slides, Natural History, Scientific and Technical. The closing date for entries is Monday, 20th September, and Entry Forms giving full particulars are obtainable from the Exhibition Secretary, Mr. E. G. Alderman, Ruardean, Newton Street, Rotherham.

Stolen from the premises of the Istead Cinematographic Service, of 4, Colonnade Passage, New Street, Birmingham, 2, a Ditmar 9.5-mm. Ciné Camera, No. 4011, fitted with f/1.8 Berthiot lens. Any reader who may be able to assist in tracing the lost camera is asked to communicate as speedily as possible with the above address.

We have been asked to mention that Mr. A. H. Long, of 33, Finchley Road, S.E.17, has a number of back copies of *The Amateur Photographer* that he will be pleased to give to any reader who would like to have them. They are dated between 1932 and 1936.

The prize-winner of the latest Wallace Heaton "Sunbathing Studies" competition is Mr. J. E. Hoskins, 16, Shirley Avenue, Acomb, York, who receives the weekly 21s. award. Full particulars regarding these competitions for "A.P." readers appear regularly in our advertisement pages.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. The series from No. 1 to 61 included all standard chemical and optical formulæ and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulæ issued by the leading manufacturers of plates, films and papers.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5×3 , supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is $5\frac{1}{2} \times 3\frac{1}{2} \times 3$ and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

90. Makers' Formulæ: Developers for Barnet Papers—(3)

Stronger Contrasts on Verona Paper.

Metol	15 grs. (1.55 grm.)
Hydroquinone ..	60 grs. (6.25 grm.)
Sodium sulphite (anhydrous) ..	240 grs. (25 grm.)
Sodium carbonate (anhydrous) ..	310 grs. (32 grm.)
Potassium bromide ..	150 grs. (15.5 grm.)
Water to	20 oz. (1,000 c.c.)

If crystallised sulphite is used, take 480 grs. (50 grm.). If crystallised carbonate is used, take 840 grs. (87.5 grm.).

This developer should be used undiluted at a temperature of 65 degrees Fahr. Exposure must be adjusted so that development takes from $2\frac{1}{2}$ to 3 minutes.

Used with Verona paper (it is not recommended for Verona de Luxe) this developer gives considerably stronger contrasts than the normal M.Q.

Brown Tones on Verona de Luxe.

Metol	4 grs. (0.5 grm.)
Sodium sulphite (anhydrous) ..	315 grs. (34 grm.)
Glycin	45 grs. (5.5 grm.)
Hydroquinone ..	45 grs. (5.5 grm.)
Sodium carbonate (anhydrous) ..	232 grs. (25 grm.)
Potassium bromide ..	15 grs. (1.5 grm.)
Water to	20 oz. (1,000 c.c.)

With normal negatives, take 1 part of developer and add 2 parts of water. Use at 65 degrees Fahr., when development should be complete in 2 minutes.

If warmer browns are required, dilute with 3 or 4 parts of water, or add bromide up to double the amount given, and increase exposure.

Verona de Luxe requires approximately the same exposure with this developer as with the normal M.Q. developer provided both are used at standard dilutions.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

An Exposure-Meter Query.

I have been using an Ombrux meter, which for the old I.S.S. film I set at 30 degrees Scheiner. I have recently changed to a Weston meter, in connection with which I rate the new I.S.S. film at 32 Weston. Does this represent an increase or decrease of exposure, taking into account the higher speed of the new film?

H. B. (Birmingham.)

Without a comparison of the readings given by the two meters on the same subject we cannot possibly tell whether or not you are giving a slight increase in exposure under the new conditions. If you cannot tell this for yourself by inspection of your negatives, we think you may quite safely conclude that any difference there may be is quite unimportant.

Focussing Scale.

I have a folding camera which focusses by rack and pinion, and I attach a diagram showing the markings of the scale. Can you tell me whether it is marked in feet, yards, or metres?

P. T. L. (Folkestone.)

There is nothing in your diagram to indicate for what the units are intended, especially as we have no idea of the focal length of your lens. It is a simple matter, however, for you to take a photograph with the scale set, say, at the figure 3, and then see at what distance from the lens the sharpest definition appears.

Decomposed Hardening Fixer.

I recently made up a hardening fixer containing alum, and on going to the bottle some weeks later found a heavy yellow precipitate and a smell of bad eggs. Will it be safe to use this solution if I filter out the sulphur? A. F. (Manchester.)

Your decomposed fixing solution should be thrown away, as negatives or prints fixed in it will be liable to brown stains owing to the presence of sulphuretted hydrogen. This decomposition of the hypo takes place if the alum is added to a sufficiently hot hypo solution, but should not occur if the solutions are mixed cold, as is generally advised.

Scratched Film.

I enclose a negative and wonder if you can indicate the most probable cause of the scratches, which are most marked on under-exposed negatives. The camera has been sent to its makers, who have overhauled it, looking at lens, rollers and bellows, and they assure me that the scratches do not arise through any fault in the camera.

S. C. (London.)

We cannot say what is the cause of the scratches on your films, especially as the makers who have overhauled the camera can find no reason for the trouble. In our experience, the commonest cause of scratching is winding the film while the camera is closed, the surface of the film thus being dragged over the back of the bellows. If you have been in the habit of winding the film in this way that would account for the trouble.

A Filter on a Box Camera.

Is it possible to record clouds in photographs taken with a box camera? I have used a filter, but without effect. And since both stop and shutter speed are fixed, how can I double the exposure when using the filter? N. C. (Leicester.)

If a camera has no means of varying the exposure, either by altering the stop or the shutter speed, you cannot possibly make allowance for a filter, other than by using it only when the light is particularly bright. You can often get good skies without a filter, but, except in experienced hands, it is largely a matter of chance, as it is a thing which requires careful attention to both exposure and development.

Scratched Lens.

I have recently bought a camera fitted with a high-grade lens, but this, unfortunately, is scratched. I enclose some prints, from which you will see that the bottom third of vertical pictures, and the left-hand third of horizontal ones, is badly blurred. Is this the result of the scratches on the lens? And if so, could the scratches be removed in any way? C. F. (Mill Hill.)

There is nothing to suggest that the scratches on the lens are having any ill effect. We should say that the cause

of the defects is, quite certainly, that the film does not lie correctly in the focal plane of the lens.

You should have the camera overhauled, so as to make sure that the front is parallel with the back and not inclining to it at an angle.

"A.P." Exposure Tables.

The Monthly Exposure Table in "The A.P." has quite disappointed me, as the variations in exposure recommended from month to month do not agree at all with the relative brilliance of the light. But perhaps you could give me a multiplying factor for the Tropics and similar conditions?

K. M. N. (Kuala Lumpur.)

"The A.P." exposure tables are worked out to suit the variations of light in England, and are completely wrong for tropical countries. No simple multiplying factor can correct the discrepancies, for a different factor would be needed for every month and for every hour of the day. We should recommend you to use in place of our tables either the Burroughs Wellcome Exposure Calculator or the Selo Exposure Guide, both of which contain light-tables for all latitudes. The first is contained in the Wellcome Photographic Diary, published yearly at 1s. 6d., and the other is distributed free by Messrs. Ilford Ltd., of Ilford, London, E.

Three Lenses or Four?

Most manufacturers offer both a three-lens and (at a higher price) a four-lens anastigmat as alternatives. What is the difference between the two types? And if four glasses are necessary to give full correction of all aberrations, is it correct to call the three-lens instrument an anastigmat? J. L. T. (Birmingham.)

Both are anastigmats, though of different degrees of perfection. On the whole the difference between the three-lens and the four-lens anastigmat is that in the latter the aberrations are more nearly reduced to zero over a wider field, and colour is more completely corrected for over the spectrum as a whole. The result is that a four-lens anastigmat can give slightly sharper definition than a three-lens, especially when working at a wide aperture. You will in practice not notice much difference between the two, except when very considerable enlargement is contemplated.

The slightest imperfection in mounting or in assembly can reduce the performance of a poorly-made four-lens anastigmat to well below that obtainable from a really well-made three-lens anastigmat, and the performance of either can be ruined completely by the slightest lack of accuracy in the camera itself.

Speeds for Extinction Meter.

I have an extinction exposure meter marked in Scheiner speeds. Could you tell me the speeds on that system of Ilford Auto-Filter plates and of Selochrome roll film?

A. F. S. (Hemel Hempstead.)

As a basis for trial with your exposure meter you should take the Selochrome film as 28° Scheiner, and the Ilford Auto-Filter Plate as 22° Scheiner. These approximately represent the actual speeds, but you may find it necessary to adopt artificial speed numbers to compensate for any peculiarities in your own method of handling your exposure meter. This you will only find by experience.

Put COLOUR into your next pictures

You load and expose the film in exactly the same way as ordinary stock. No filters are necessary. No attachments. Speed and latitude are both good. For example, a typical exposure would be "Middle of the day; sunshine; 1/25 sec. at f.8." On dull days exposures are relatively longer, but the recorded colours, even in the shadows, are still crystal-clear and crisp.

Development and finishing are done by us, through your local dealer. Any number of black-and-white prints can be made in addition to the original colour transparency.

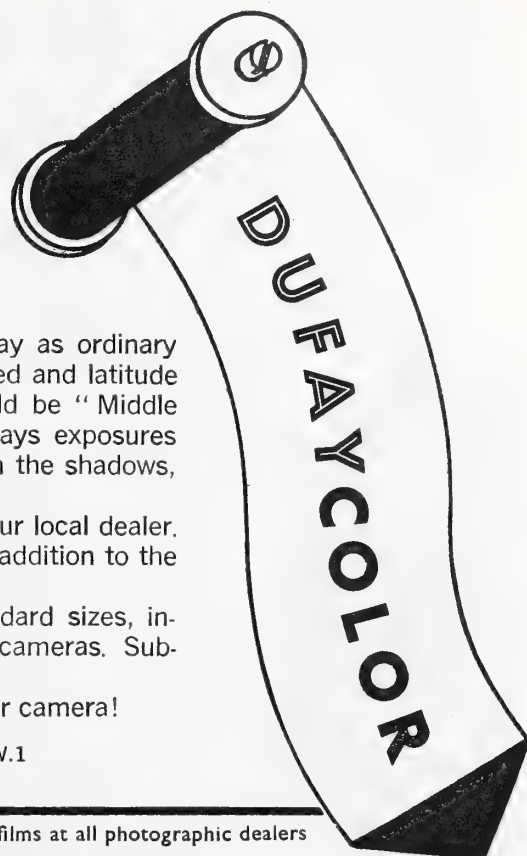

Dufaycolor films and packs are obtainable in all standard sizes, including 35 m.m. film for Leicas and similar miniature cameras. Sub-standard cine film (used with filter) is also made.

Put life in your next pictures. Put DUFAYCOLOR in your camera!

MALLINSON'S FREE-LANCING SERVICES

THE secret of Mallinson's success lies in his individual collaboration with each member. To succeed in your hobby pictorially, or in Competition or Free-lancing, put yourself in the hands of Mallinson's Free-lancing Services, who last year broke all records for the placing of photographs and the winning of prizes since their establishment many years ago.

MALLINSON'S invariably give chapter and verse for all their claims and successes. Instant proof can be had in respect of placings, winnings and testimonials. Trust the firm that opens its books to you.

This photograph was taken by a Mallinson member—it is quite simple, but to date it has the following successes: "Home Photographer" Competition, £2 2 0; "Weekly Telegraph," 15s.; "Cheshire Life," 10s. 6d.; "Daily Post," 15s.; "Amateur Ciné World," 10s. 6d.; "Reynolds' News," 15s.; "Evening Chronicle," 10s. 6d.; and abroad, 7s. 6d., making a total of £6 6 0.

★ Send for a prospectus without delay and read Mr. Mallinson's book "Free-lance Journalism with a Camera" (80 illustrations), price 3s. 11d. post free.

MALLINSON'S FREE-LANCING SERVICES

(Dept. A.P.), Rose Crescent, CAMBRIDGE.

MAKE MONEY

with your camera

Do you know that in the British Isles alone more than 6,000 newspapers, magazines, trade journals, and advertisers buy literally hundreds of thousands of photos every year—and are always on the look out for more?

Think what this can mean to you! These buyers of photographs are not biased—they'll purchase your pictures as readily as those from other free-lance workers. But they must have a certain quality—a "something" about them that makes them more interesting than the average snap. We can show you by the J.P.D. "Personalised" Method just how to get that quality—that "something" into your pictures. We show you that, and every other phase of camera-journalism from the taking, developing and printing to advice as to the requirements of newspapers, magazines, periodicals, photographic agencies, advertising companies and other commercial firms. Also we give guidance and collaboration in regard to photographic competitions.

PERMANENT MARKETING ADVICE AND SERVICE FOR YOUR PICTURES

We need hardly emphasise that in acquiring the knowledge necessary to produce PICTURES THAT SELL you greatly increase your pleasure in your hobby, for obviously photos with life and interest in them are a much greater reward for your trouble than mediocre results. The profitable income they can produce for you is an added extra incentive to learn the J.P.D. method!

SPARE OR FULL TIME

You can devote as much or as little time as you wish—you can work all the year round—there is as big a demand for photographs of winter scenes, etc., as for summer. (No special or expensive camera and other equipment is necessary.)

Are you interested? Of course you are! Well, it places you under no obligation to send for this intensely interesting FREE book, which gives full particulars of the J.P.D. Personalised Method.

Fill in NOW and post coupon for this magnificent FREE BOOK

SEND US YOUR PHOTOS.

You are invited to submit to us a selection of your present photographs, some of which may possess journalistic worth. In any event we will freely give you our opinion as to their potential value.

The success of our members can be gauged from the following extracts:—

"Journalistic photography is so fascinating as spare-time work that as soon as possible I intend to make it a full-time occupation."

"I have earned in the last two months £23 from pictures."

"One picture alone sold for five guineas."

"Your last cheque for two guineas is positive proof of the efficiency of your service."

"I never realised the vastness of the field, the greatness of the demand as opposed to the supply, and the further I proceed the more interesting and profitable it becomes."

"Your marketing and sales service are a great advantage, and so fair that the utmost confidence is felt."

PURMA SPECIAL

**A NEW KIND OF MINIATURE CAMERA
EASIEST TO USE · CHEAPEST TO RUN
OFFERS A WIDE RANGE OF PHOTO-
GRAPHY FOR THE LOW COST OF 50/-**

Purma Portrait Attachment, 3/6. Ever-ready leather carrying-case with shoulder strap, 10/6. Carrying sling, 2/6.

The cleverness of the design of the PURMA SPECIAL lies in the absence of knobs to turn and gadgets to confuse—and in its ability to produce good photographs in all weathers. Tests have proved it. Nothing could be simpler to operate. There is no focussing—everything from 12 ft. to infinity is dead sharp—no lens aperture or speed dial to set—no calculations of any kind.

The highly efficient all-metal focal-plane shutter has three speeds capable of dealing with poorly-lighted subjects up to the quickest action. The speeds are 1/25th, 1/150th and 1/450th sec. The adjustment of speed is automatic—decided by one of three ways of holding the camera. A fast f/6.3 lens. 16 pictures (1½ × 1½) on ordinary vest-pocket roll film for 1/-.

With the Purma Special no opportunities are lost. Remember there are no adjustments to make—the camera is always ready for action—you just hold it up and shoot—as simple as that—and as quick. And you can get clear, crisp pictures every time.

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS:—

12 words or less.....2/6
2d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 280, Deansgate, Manchester, 3; 26a, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer," when both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged; over £10 and under £50, 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to **ILIFFE & SONS LTD.**, and crossed

& Co.

Notes being untraceable if lost in transit should not be sent as remittances.

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

SALE

of Guaranteed Used Movie Cameras

We've had a very good summer, meeting
old friends and making many new ones,
and we thoroughly enjoyed converting
several die-hard still photographers into
movie enthusiasts. Now we wish to
celebrate, and, as a token of goodwill,
we are practically giving away about
fifty first-class movie cameras. We are
holding every item mentioned below
until this issue of "The A.P." is on sale.
Therefore, write or call at once, and
you will not be disappointed.

AGFA V.P. SPEEDX

The popular holiday camera with 1/3.9 lens
£5 5 0 cash

'BALDAX'

For 16 pictures on 2½ x 3½ roll film.

A very compact and pocketable camera. The precision mechanism and design combine to produce perfect pictures. All-metal body, leather covered, nickel fittings, and direct-vision view-finder composed of two optical units enables quick finding of the picture. Pressure plate holds film in exact focal plane during exposure. F/2.9 Meyer Trioplan anastigmat, delayed-action Compur shutter.

Cash price **£9:0:0**

15 monthly payments of 12/7.

9.5-mm. DUFAYCOLOR. The new colour film for 9.5-mm. cameras. Easy daylight loading. Now in stock. Price 10s. 6d. for 39 ft., including processing.

NOW AT BOND STREET—COMPASS ROLL FILM BACK! Takes place of normal hinged back of Compass Camera, and enables use of six-exposure roll films. Positive one-turn-per-picture winding, retracting pressure plate. Increases thickness of camera only 1 in. **£5 0 0.** Two six-exposure spools cost 1/9.

ALL THE LATEST PROJECTORS IN STOCK!

SIEMENS '8' PROJECTOR

One of the finest 8-mm. projectors yet produced. It has 200-watt 50-volt lamp. Gives brilliant pictures up to 6 ft. wide. Busch Neostar lens supplied in 25 or 35 mm. focal length. Adjustable speeds from 10 to 20 pictures per second. Single picture device. Self-contained resistance. Siemens motor A.C. or D.C. 100/250 volts **£37:10:0**

24 monthly payments of 33/8.

Also 8-mm. camera, as illustrated. List free.

STRIP PRINTS FROM LEICA and OTHER 36-exposure 35-mm. FILMS

Here's a chance to get contact prints at about a penny each. We are doing a full 36-exposure strip of prints on paper at 3/8, or on transparent film, so that you can project them as "stills" on the cine screen, for 5/- per 36 exposures.

WARNING—"Automax" (Regd.) Prints

It has been brought to the notice of Master Photo Finishers Ltd. (Wallace Heaton, Managing Director) that a number of firms have been supplying prints of their own, under the description of "Automax". Please note that these prints are the particular product of Master Photo Finishers Ltd., and that "Automax" is their registered trade mark. Anyone detected in supplying under the description "Automax" prints which are not made by this company will be proceeded against. "Automax" prints can be ordered from Wallace Heaton Ltd., of 127, New Bond Street, London, W.1, and branches, also from branches of City Sale & Exchange (1929) Ltd., and from other dealers who are authorised by Master Photo Finishers Ltd., to retail "Automax" prints.

No print is a genuine "Automax" unless it bears the trade mark "Automax" printed on the back.

ENSIGN MAGNAPRINT SUPER-SPEED CONDENSER ENLARGERS

For use with Leica and Contax lenses.

This Magnaprint is made specially to enable the Leica or Contax owner to use his lenses for enlarging purposes. The front is provided with a helicoidal focussing device into which the lens screws. Fine focussing can then be carried out on the lens mount if desired. A suitable carrier for strip film is provided.

Model VO/L for use with Leica lenses (without lens) **£5 15 0**

15 monthly payments of 8/1.

Model V/O, for 1 V.P., Leica and Contax negs. With Ensar 1/6.3 lens... **£5 5 0**

15 monthly payments of 7/5.

The AMATEUR ^{4D} PHOTOGRAPHER

& CINEMATOPHOTOGRAPHER

~ The Journal for Everybody with a Camera ~

Vol. LXXXIV.

Wednesday, September 8th, 1937.

No. 2548.

Time was when the Amateur photographer used to think of packing away his camera at the end of the season. But

Leica

THE PIONEER MINIATURE CAMERA

has changed all that. The Leica owner knows no season; all the year round he is reaping a harvest of incomparable pictures. He is no longer dependent on sun, nor even on good light. He discovers new beauties in a late autumn or winter landscape. He can take pictures indoors or even at night. The Leica in fact has opened up new and exciting possibilities which were not dreamt of a few years ago.

Ask any good-class photographic dealer for a demonstration, or write for literature to:

E. LEITZ (LONDON), 20, MORTIMER STREET, LONDON.W.1

True to their colours

Flesh tints, dress tints, sky and grass . . . their accurate rendering in monochrome combined with the most delicate grading of tones . . . these have brought the photograph to life! They are obtainable by the use of

LEICA IIIa

38/7 a month for 24 months.

Chromium model, speeded to 1/1,000th sec., f/2 Summar lens in collapsible mount, 35 exposures at a loading. Cash price **£43:0:0**

Colour Film for Leica now in stock.

90/94 FLEET ST., LONDON, E.C.4

C.2; and WALLACE HEATON LTD., 127, NEW BOND STREET, W.1; 47, BERKELEY STREET, W.1; 7.8; 1a, AVERY ROW, W.1

“COMPASS”

With range-finder, exposure meter, light filters, panoram and stereoscopic attachments integrally built in. F/3.5 Kern anastigmat. Takes standard “miniature” pictures on plates or film in 6-exposure spools, both with daylight loading. Special roll film back and plate envelopes always available. Come and see it at the Westminster, or write for full description.

£30 Liberal exchanges. Balance by 12 or 24 payments.

ROLLEICORD

1a ENTIRELY NEW... POPULAR PRICED

Gives the usual Rolleicord picture 2½ square (12 on normal 3½ × 2½ spool), and comprises most of the noted Rolleicord features.

With f/4.5 Zeiss Triotar anastigmat, Compur shutter, 1 to 1/300th sec., T. and B., automatic film winding, metal body with leatherette covering.

£12 : 10 : 0

12 monthly payments of 21/11, 24 of 11/-.

VOIGTLANDER BRILLIANT...

NEW MODEL

A highly popular camera now offered in new deluxe form. Body moulded of special unbreakable material, comprising built-in hold-all for filters, supplementary lenses, etc. Takes 12 pictures 2½ square on normal 3½ × 2½ spool. Automatic film wind prevents all risk of overlapping. Lens, f/3.5 Voigtar in Compur Rapid shutter, 1 to 1/500th sec. A special “sports” direct-vision finder greatly facilitates rapid working.

£9 : 0 : 0 12 monthly payments of 15/9.

AGFA ‘KARAT’

12 pictures 24 × 36 mm.
(LEICA size) for 1/5

Special f/6.3 anastigmat of very fine quality. Shutter gives speeds of 1/25th, 1/50th, 1/100th and B., carefully designed for simplicity and maximum results. Automatic film wind renders double exposures impossible; easy loading with self-threading. Most efficient and accurate optical finder.

Only £5 : 5 : 0

12 monthly payments of 9/2.

VOIGTLANDER BESSA NEW AND IMPROVED

For 8 3½ × 2½ or 16 1½ × 2½ on normal spool.

A much improved model in this favoured series. With new optical finder, shielded and automatically springing into position, also automatically adjusting trigger release and film windows. With f/3.5 Voigtar lens and Compur Rapid shutter, 1 to 1/400th, T. and B., and delayed action.

£10 : 17 : 6

12 monthly payments of 19/-, 24 of 9/6.

ZEISS IKON SUPER IKONTAS

NEW MODELS

For 16 pictures 2½ × 1½ on normal 120 spool. With f/3.5 Tessar, Albada finder, side release, etc., also automatic locking device, positively obviating double exposures, and Compur Rapid shutter to 1/500th sec. £22:15:0

12 monthly payments of 39/10, 24 of 19/10.

Also Model II (8 pictures 2½ × 3½ or 16 1½ × 2½). Tessar f/3.5, Compur Rapid shutter to 1/400th sec., automatic locking device, Albada finder, side release £26:5:0

12 monthly payments of 45/11, 24 of 23/-.

WESTMINSTER Plan remains unbeatable!

The undoubted advantages of the WESTMINSTER'S OUT-OF-INCOME PLAN remain substantial and decisive as ever. No delays, no difficulties, no drawbacks—but valuable and exclusive safeguards giving complete CUSTOMER PROTECTION as a right. No matter what the price or description of the apparatus you wish to acquire, you'll find you cannot do better than go to the WESTMINSTER.

Two Fine Offers

Over £6 Saved

£9:17:6 instead of £16:5:0

Westminster offer strictly limited number only—

ZEISS IKON

Model 530/15

Super Ikonta

Each and all these fine and much-sought-after cameras are brand new, as normally issued.

The magnificent specification includes ZEISS IKON BUILT-IN REVOLVING WEDGE RANGE-FINDER, famous Zeiss f/4.5 Triotar anastigmat, Klio shutter, 1/5th to 1/100th sec., and delayed action, optical direct-vision finder, rapid self-recting front, etc., etc.

Most Attractive Picture Sizes.

For 8 exposures 4½ × 2½ in. on normal spool, with option of 16 2½ × 2½ by removable mask. Full size is most pleasing shape and of generous dimensions; smaller is amply big enough to give good picture of itself, yet exceedingly economical.

WESTMINSTER BARGAIN PRICE

12 monthly payments of 17/4.

£9 : 17 : 6

Listed at £11—Offered by WESTMINSTER at £7:17:6

(saving £3:2:6)

BRAND NEW.

BALDINA Miniature

These BALDINA Miniatures are exceptionally attractive little cameras of marked compactness and high precision workmanship. Take 36 pictures on standard 35-mm. daylight-loading cassettes. Automatic counting. Lens is f/2.9 Meyer Trioplan, with Compur shutter to 1/300th, parallax corrected, tubular finder. Entirely unused, as normally issued by the makers with instruction book, etc., complete.

NEW VOIGTLANDER OPTICAL-FINDER

"BESSA"

The new optical finder springs into position, with its shield removed, directly the camera is erected, making it easy to select the best angle of view. It has automatic trigger-release and changes automatically from 8 to 16 pictures, or vice versa, on 3½×2½ roll film. With 1/3.5 Voigtlander lens and Compur Rapid shutter, speeded to 1/400th sec., T. and B.

Cash price **£10:17:6**
24 monthly payments of 9/9

NEW MODEL Ia ROLLEICORD

Takes 12 pictures on 3½×2½ roll film for 1/7. Shows the picture full size and right way up on the ground-glass screen. Easy to use easy to get dead-sharp focussing. Built to the well-known Rollei standard. Has art leather-covered body. Fitted with 1/4.5 Zeiss Triotar lens and Compur shutter.

Cash price **£12:10:0**
24 monthly payments of 11/3.

Rolleicord Model II, winner of many prizes in last year's photographic competitions. With 1/4.5 Zeiss Triotar lens and Compur shutter speeded to 1/300th sec., T. and B.

Cash price **£14:10:0**
24 monthly payments of 13/.

ENSIGN MINIATURE MAGNAPRINT

The lamp body is constructed of light metal. It has a removable top fitted with a lamp-holder. Its tubular mounting is very rigid, free from vibration, and provides ventilation to the condensers. For focussing the body slides freely on the supporting column, and clamps in the required position. Fine focussing is then carried out by the helicoidal lens mount which is provided with a large knob which locks it firmly in position at the required point. Takes half-V.P. Leica and Contax negatives. With 1/6.3 lens.

Cash price

£5:15:0

15 monthly payments of 8/1.

CINÉ-KODAK

"8"

9/- A MONTH or 24 months.

With fixed-focus 1/3.5 lens, exposure guide, footage indicator and eye-level finders. Holds 25 ft. of special film, only half the width of which is exposed at a time.

Cash price **£10:0:0**

Lime Street bargains are far above the ordinary standard at the best of times—but our confidential payment plan makes them easier than ever to get. THE 4x4 cm. Rolleiflex

THE MINIATURE OF
MINIATURE REFLEXES

GIVING TWELVE
PICTURES ON 1/
V.P. ROLL FILM

If you want a smaller camera retaining all the famous Rolleiflex qualities—here's the very thing!—it shows the picture full size and right way up on the focussing screen, and has the excellent feature of a magnifier fitted over the peep-window so that shutter speeds and lens apertures are shown up in magnified form. It has f/2.8 Zeiss Tessar lens and Compur Rapid Shutter, speeded to 1/500th sec., T and B. This model is used exclusively by many of the leading exhibition workers. It takes the majority of the 6x6 cm. Rolleiflex accessories, and is a really versatile instrument. Price £26.

The 6x6 cm. Rolleiflex taking 12 pictures on 3½x2½ roll film, with f/3.5 Tessar lens and Compur Rapid shutter. £25.

- Shoots sequence pictures with machine-gun speed.
- Lens always in "ready" position—no withdrawing necessary.
- Film winds itself automatically.
- Shutter sets itself automatically.
- Film counter operates automatically.
- No double or overlapping exposures possible.
- Automatic "Zone" focusing gives needle-sharp definition and supersedes rangefinders.
- Takes up to 50 exposures on Standard 35-mm. film.
- Dual cassette loading permits removal of any part of film at any time for development.
- Camera opens in daylight for changing from "pan" to colour film at any moment.
- With motor wound takes from one up to 24 exposures in quick succession, or singly.
- Motor can be left permanently wound.
- Incorporates filter suitable for "pan" or "ortho" films.
- Exposure automatically compensated when using filter.
- Shutter gives "Time" and from 1 sec. to 1/500th sec.—and all intermediate speeds.
- Weighs 14 oz.—just heavy enough to be held comfortably without risk of movement.
- Overall size only 4½x2½x2 in.
- Three view-finders in one, including "right-angle" for "candid" work.
- Daylight-loading spools available.
- Camera has stainless steel body, covered black morocco.

WE ARE NOT POETS—WE CANNOT SING !!!

—neither are we much good at “wisecracks”—but see how others sing the praises of the now famous VAUXHALL CAMERAS. Remember that the reviews and testimonials quoted are from people who count. These people of experience have submitted these cameras to real practical tests and we think that this is of greater advertising value than blowing our own trumpets—We have spoken !!!

RANGE-FINDER VAUXHALL MINICAM

Here is a coupled range-finder miniature, fitted with the finest quality f/2.9 anastigmat lens in delayed-action Compur shutter, selling at a price which YOU can afford. Actually its nearest competitor is approximately 40 per cent higher priced—BUT the Vauxhall has numerous advantages not to be found in other cameras of this type. For instance, it takes two sizes of picture according to choice—either twelve or 16 square or 16 2 1/4 x 1 1/8. Another exclusive feature is the special radial focussing lever which automatically springs back into the infinity position when the camera is closed, thus preventing any possible damage to the camera or focussing mechanism.

PRICE £11 15s. ONLY

Yours for 20/7 down and eleven similar monthly payments.

AUGUST PRESS REVIEWS ON THE NEW RANGE-FINDER MINICAM

“... We comment favourably upon a number of good points in this instrument, not the least attractive being the remarkably low price. The whole job is very well made, and our tests confirm the good opinion we formed of it upon inspection. The range-finder was photographically tested at full aperture on close-ups, medium distance and long-shots, all of which proved to be dead sharp on enlarging. The lens is of excellent quality, the price is only £11 15s. complete so that the many advantages of a coupled-range-finder camera are now available to a much wider public than hitherto.”

—*Miniature Camera Magazine.*

“... One important feature is the fact that immediately the side-struts are pressed to close the camera, the focussing lever, wherever it may be set, automatically returns to the infinity position, thus preventing any possible damage to the focussing mechanism. The Vauxhall Super-Minicam sells at £11 15s., which in consideration of its useful features and wide-aperture lens is exceptionally good value.”

—*Miniature Camera World.*

“... In spite of the comparatively large picture taken, the camera itself is by no means bulky. The Super-Minicam is sold at £11 15s., which is a very moderate price for a camera with its specification.”

—*The Amateur Photographer.*

A PRESS PHOTOGRAPHER'S TESTIMONIAL—

24, Buchan Street,
Maaduff, Banffshire.
17th August, 1937.

The Camera Co.,
320, Vauxhall Bridge Road,
Victoria, S.W.1.

Dear Sirs,—Some time ago I purchased from you a Vauxhall Minicam, fitted with f/2.9 anastigmat, and I am so pleased with its performance that I feel I must write and thank you for putting a very efficient camera on the market at such a low figure.

Enclosed are a few of the many reproductions I've had accepted by local papers; all of these ranging from high-speed work to interiors were taken with the Vauxhall which is my constant companion. Most of my subjects are the candid type, which give you very little time to manipulate a camera, and are very often found in poor lighting conditions; however, the Vauxhall is perfectly fit to cope with these subjects.

I use the Vauxhall almost entirely for press work, and only where exceptional subjects, such as require rising front movement, occur does another camera have the precedence. I am also enclosing a few prints to show you the fine definition I get with ordinary rough-grained films.

Please return press cuttings and prints, for which I herewith enclose a stamped and addressed envelope.—Yours faithfully,

(Signed) F. W. RITCHIE.

P.S.—Kindly send me the leaflet on your new Range-finder Model.

8 PICTURES 3 1/2 x 2 1/2 F/3.8 16 PICTURES 2 1/4 x 1 1/8

Streamlined all-metal body of extremely small dimensions. We have sold many hundreds of this popular-sized model during this season and we invite comparison with any instrument of similar type advertised in this journal.

STANDARD MINICAM

Constructed of Metal—NOT Bakelite.

AMAZING VALUE !!

Everybody, including the Press critics who have seen and tested the new all-metal Vauxhall Minicam, are amazed at the value. This low price is only possible because of the fact that we, as sole distributors, import large numbers direct from the factory in Germany, and, in addition, we are content to sell at a small profit. If you purchase a Vauxhall Minicam you will be saving approximately 50 per cent against the price of its nearest competitor.

PRICES :

With f/2.9 anastigmat, micrometer focussing mount, D.A. Compur shutter..... **£6:19:6**

Ditto, with unique radial focussing **£7:19:6**

Ditto, with Prontor D.A. shutter..... **£5:19:6**

Or 12 monthly payments of 12/3, 14/- and 10/6 respectively.

CRITICS' VIEWS

on the New VAUXHALL DUAL-SIZED MINICAM

“... We gave this instrument a thorough test and found it operated excellently. The price is remarkably low, being £6 19 6 only.”

—*Miniature Camera Magazine.*

“... This new model is well and rigidly built and the price £6 19 6 is truly remarkable.”

—*The Camera.*

“... In appearance this camera is very attractive. The body being covered with morocco leather, and all bright parts plated. The Vauxhall camera is very good value for the price.”

—*Miniature Camera World.*

“... This newly introduced camera is decidedly neat and small for the size of picture it takes, and sells at a very reasonable price.”

—*The Amateur Photographer.*

“... On test the camera performed well. The general construction is particularly rigid and is good value at £6 19 6.”

—*The Home Photographer.*

Speed then to take advantage of the field

—“KING JOHN”

When to Warm Tone (by straight development)
Is added Speed that rivals Bromide's skill.
So that enlargements, matching contact prints,
Can with a like facility be made ;
The sum of Mezzotone's advantages
Has but begun its dizzy, upward climb,
Add to it Latitude, that useful tolerance,
And then Long scale Gradation, detail true
Unto the negative's full tonal range.
A dozen surfaces, of Character,

On which to picture every mood and mode.
And with each attribute such constancy
As stamps the goldsmith's chain in every link
The total thus compiled a column builds
O'er topping all the giants in the field.
To this array of qualities supreme
Is added now the satisfying news
That Mezzotone retails at Bromide paper price,
For all the world to share its print appeal.

MEZZOTONE

ANNOUNCING

Price Reductions

MODEL G.3 for 8, 9.5 and 16 mm. films.

PAILLARD-Bolex PROJECTORS

New Models!

New Values!

Increased demand for Paillard-Bolex projectors makes it possible not only to reduce prices, but to introduce a number of new models, covering all sub-standard projector needs. Whatever your requirements, they can now be met by a high-power projector giving the tremendous screen luminosity and pin-sharp definition for which Paillard projectors are famous.

- **MODEL G.3**, for 8, 9.5 and 16 mm. films. Screen performance absolutely flickerless. Immense screen illumination with pin-sharp definition over whole picture area. Silent running and minimum film wear. All-enclosed 100 per cent gear-driven mechanism. All the latest ciné refinements, including: still pictures, instantaneous reverse, motor rewind, interchangeable lamps, 500-watt or 250-watt (the latter costing only 21/-). Change from one film size to another only takes a few seconds. Projector, with accessories, fitted 2-in. lens and 500-watt lamp, price, including resistance..... **£52 10 0**
- **MODEL G.916**, the same as above, but for projecting 9.5 and 16 mm. films. With resistance..... **£45 0 0**
- **MODEL G.816**, the same as above, but for projecting 8 and 16 mm. films. With resistance..... **£45 0 0**
- **MODEL G.16**, the same as above, but for projecting 16-mm. films only. With resistance..... **£39 0 0**
- **MODEL G.8**, the same as above, but for projecting 8-mm. films only. With resistance..... **£39 0 0**

Write for details to Dept. A.P.

New D.A. 37 for 9.5 and 16 mm. films.
With resistance. **£29 17 6**

PAILLARD CINE CAMERA.
Models for 9.5, 16 and double 8 films. Critical visual focuser. Dallmeyer f/1.6 speed anastigmat..... **£55 0 0**

- THE NEW IMPROVED MODEL D.A.37 for both 9.5 and 16 mm. films. Fitted 400-watt lamp and Meyer f/1.6 40-mm. lens. Mechanism equivalent to a three-bladed shutter, giving perfectly flickerless projection. Complete with resistance..... **£29 17 6**

CINEX LTD. 70, HIGH HOLBORN LONDON, W.C.1.

GOODNIGHT, ARCHIBALD . . .

WE'RE GOING TO BED! . . . FOR GOODNESS SAKE GET A MODERN ENLARGER, AND DON'T STAY UP HALF THE NIGHT.

Yes, Sir! that's just the trouble, yours is an old-fashioned horizontal outfit—it takes two minutes to sandwich the film in the glasses, three minutes to focus, more or less incorrectly, and four minutes to expose—and then—Blow it! if there isn't a spot of fluff over Grandma's glass eye! Archibald or not, we know you would like a decent Enlarger. You will get it from Pelling & Cross.

Magnaprint AV/11, $3\frac{1}{2} \times 2\frac{1}{2}$, automatic, f/4.5 Dallmeyer, double condenser **£13 10 0**
Model V/10, $2\frac{1}{2} \times 2\frac{1}{2}$, non-automatic, f/6.3..... **£8 10 0**

FILMAREX.

Filmarex 110 **£11 8 6**
 Single condenser, f/4.5, iris, strip-film holder, for 6×6 cm. up to 7 times enlargement.

Filmarex 113 **£17 17 0**
 As above, but opal diffusion, for 6×9 cm. up to 7 times.

Filmarus 101 **£9 13 6**
 Single condenser, f/4.5, iris, strip holder, 2-10 times enlargement. For 4×4 cm. and smaller.

FILMARUS.

Fam Automatic 303, single condenser, f/4.5, iris, strip-holder, for 6×6 cm. Up to 7 times. **£18 18 0**

Fam Automatic 305, opal diffusion, for $3\frac{1}{2} \times 2\frac{1}{2}$ in. Up to 7 times. Otherwise as above **£21 0 0**

Rajah Model 28, double condenser, f/4.5, strip-holder. For 6×6 cm. and smaller up to 7 times. **£11 10 0**

Vertex Models, for all sizes up to 6×6 cm., single condensers, f/6.3 or f/4.5 anastigmats. Prices from **£6 6 0 to £10 10 0**.

Your specification? of the Complete Camera

The Compass Camera
 extended, half actual size.

SPECIFICATION

Exposure meter; range-finder; focussing scale; right angle and direct vision view-finders; depth-of-focus indicator; screen and magnifier for composition and focussing; specially designed high-speed wide-angle (F/3.5) lens by Kern; lens

cover and hood; set of three filters; spirit level; panoramic and stereoscopic fittings.

The Compass Standard back for use with glass plates is interchangeable with the new roll-film back. All within a space less than a packet of 20 cigarettes and weighing less than 8 oz.

You would like to include so many essentials in your ideal camera that you are afraid it would be too cumbersome and heavy. Read the accompanying Compass Specification and consider if this does not tally very closely with your own conception of the complete camera. Then consider the portability of Compass. It can be carried in a man's vest pocket, is smaller than a packet of 20 cigarettes, and weighs less than 8 oz. A miniature camera in the true sense of the word—and complete! The Compass may be examined at any Appointed Compass Dealer, or at the Company's Showrooms.

GEVAERT

Films for Miniature Cameras

are available in four varieties: Gevaert Special (Fine Grain), orthochromatic, 500 H. & D., 19° Sch.; Superchrom, fine grain, high speed, 4,400 H. & D., 28° Sch.; Panchromosa, a perfected panchromatic film, speed to daylight 4,400 H. & D., 28° Sch., to artificial light 8,000 H. & D., 30° Sch.;

Panchromosa Micrograin, possessing extremely fine grain, 1,700 H. & D., 24° Sch.

All Gevaert Miniature Camera films are available in the convenient Gevaert cartridge, also on daylight spools, and as single and multiple refills. All with 36 exposure numbering.

Gevaert Roll Films

Gayvert (Regular)

A very fast orthochromatic film for all ordinary snapshots. Possesses great latitude and is fast enough for all but the most difficult subjects.

Superchrom (Express)

Highly orthochromatic and extremely fast (28° Sch.). Anti-halation backing ensures clean outlines. Exceptional latitude. Ideal for speed subjects, interiors and difficult lighting conditions.

Panchromosa

A high-speed panchromatic film (28° Sch. to daylight, 30° Sch. to artificial light), gives true monochromatic rendering. Equally suitable for outdoor or indoor work by day or night. The high speed makes very short exposures possible.

Panchromosa Special

Similar to panchromosa but slightly lower (21° Sch. to daylight, 23° Sch. to artificial light) and has exceptionally fine grain, allowing of great enlargement.

WEDNESDAY, SEPTEMBER 8TH, 1937.

Copyright—Registered as a Newspaper
for transmission in the U.K.

VOL. LXXXIV. No. 2548.

THE Autumn exhibition season opened in London last week with the P.P.A. show at Princes Galleries, Piccadilly, W. The work at this exhibition is entirely by members of the Professional Photographers' Association, and is a representative display of British professional portraiture. About 500 prints have been selected, and needless to say many Royal and Coronation portraits are to be seen. The collection includes some fine examples of studio work and there are several subjects in which the humorous note is struck. As in previous years, these pictures form the first half of the annual P.P.A. exhibition and will be replaced on September 17th by the second half, which will be devoted to "Photography in Commerce and Industry," closing finally on September 29th. In the meantime both the exhibitions of The Royal Photographic Society and the London Salon of Photography open their doors to the public on September 11th. The former at 35, Russell Square, W.C., and the latter at 5a, Pall Mall East, S.W.

Round Figures.

Numbers of swelling rotundity have lately been appearing in the daily Press to illustrate the popularity of photography with the British public. It is stated that the number of photographs taken in a year is 250 million and that during one week in August 50 million negatives were exposed, an increase of more than 60 per cent on the number taken during the corresponding week of the previous year. It is disappointing that one cannot make more of these figures. The yearly output of negatives, big as it seems, means that if the

TOPICS of the Week

GOODBYE TO ALL THAT.

With the end of the holiday season the photographer's thoughts turn to printing from his holiday negatives.
(See article on page 286.)

negatives were put end to end they would only go one-tenth of the way to the moon and would not quite reach round the earth at the Equator. Rather more particularised is the figure showing the number of spools of film handled by a certain un-stated number of finishers during one August week. The figure of 208,274 spools sounds so much more convincing than "something approaching a quarter of a million." Moreover, it is stated that out of every 80 snaps, 79 are successful—a tribute perhaps rather to the material he or she uses than to the photographer. But what does "successful" mean exactly?

Chemicals and Light.

Important committees representing pharmacists and chemists and manufacturers of glass in other countries have been considering the ever-present problem of the light-sensitive chemical. The U.S. Pharmacopœia gives a list of over 400 medicinal substances which should be protected from light. Light works strange alterations in liquids, changing them from colourless to yellow or pink or green, and even if the alteration is no more than a colour effect it does not please the patient to see his medicine undergoing these alterations. Blue and amber glass bottles have been tried, and instructions given that some chemicals should be kept in total darkness. We wonder whether this research could not be turned the other way round, and chemical products be so manufactured that light, instead of causing deterioration, would bring them to a proper ripeness. The idea is not so foolish as it may sound, because there is one outstanding example in which a vast art and industry has been built

upon a single chemical reaction, the darkening of silver salts when exposed to light. That art and industry is, of course, photography.

When the Golf Ball is Hit.

We do not know whether some recent work on high-speed photography in which a golf ball and a club have been the subject of experiment is intended to help golfers in their play, but it certainly has its interest and probably its high importance in the study of physics. It has been done at the Massachusetts Institute of Technology. One photograph shows the golf ball and the club at the moment of impact before the ball has moved from the tee, and actually the ball can be seen to be flattened at the side which is in contact with the club. The club and the ball travel together for about half an inch, and then the ball goes ahead, and as it goes it gets flattened on another side, at right angles to its first flattening where the club struck it, and the camera is able to record all this change in the shape of the ball

while the ball is speeding along at five thousand revolutions a minute. The exposures given have been 1/200,000th of a second. Time does not permit of much finer splitting.

Antidote for Potassium Cyanide.

A recent note in these columns on methylene blue as an antidote for potassium cyanide poisoning seems to have created a good deal of interest, to judge from the correspondence and even the telephone inquiries that have reached us. Those who are interested enough to pursue the matter will find it fully set out in the *Scientific Monthly* of New York for December, 1936. Only the medicinal or chemically pure dye methylene blue should be used. The solution is most effective when made up fresh just before using. Preferably the amount of dry dye to be used should be on hand, and the mixing in distilled water should be done just before using, as an aqueous solution oxidises rapidly. An intravenous injection of 50 c.c. of a 1 per cent solution is usually successful; in some cases a

second dose or even more may be administered after a short interval.

Photographing Nuisances.

An unusual application of the camera is to the task of detecting nuisances. The sanitary inspector in the Port of London, if he sees a chimney emitting black smoke, gets out his camera and takes a photograph of it, which is used in evidence against the offender. It has to be black smoke to constitute a nuisance, and, moreover, it has to be continued for a certain number of minutes. The evidence of the photograph is sufficient as to its blackness, but, of course, only a "movie" could afford indubitable evidence as to its continuance. The camera is also used in connection with the inspection of food, and we have seen one photograph which, we were assured, was not the result of any previous arrangement, revealing a tin of tomatoes in the very act of exploding, the volatile matter leaping from the tin like a fountain right above the top of the photograph.

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with under this heading week by week. Other replies appear as usual on the last page.

Photo-Regression.

I have come across the term "photo-regression," but have no idea of its meaning; can you help me? S. E. A. (Cambridge.)

Whatever may be the action of light on a sensitive emulsion to make the development of an image possible, the effect sooner or later passes off, and no such development can take place. This diminution and final disappearance is known as photo-regression.

It was first noticed in the Daguerreotype process, when it was found necessary to process the plate immediately after exposure. The effect of light action began to decrease at once, and in a few hours it had disappeared. To a somewhat less degree the same thing applied to the wet collodion process, depending to some extent on the amount of moisture retained in the collodion itself. With gelatine dry plates the effect of exposure is retained for a long period, and there are many instances of the successful development of such plates many years later.

The rate of regression varies according to circumstances. It is somewhat hastened when the exposure is less than normal, but the character of the developing solution used seems to have no effect one way or the other. High temperature and humidity are important factors in accelerating regression, and so is the presence in the emulsion of free acid or of alum.

In the absence of acid or alum deterioration is much less rapid, and this applies to development papers as well as to plates and films. Fine-grain emulsions are more prone to rapid deterioration than others.

With the exception of wet collodion, which is still largely used for certain purposes, modern sensitive material, whether negative or positive, gives no cause whatever for anxiety on the score of regression. Exposed material is not affected

by it to such an extent as to make it risky to postpone development for any period within reason. There are, however, much more important factors of deterioration which make undue delay undesirable.

It is evident that any theory of the latent image must be able to account for regression, whether its progress be rapid or slow. For the question arises, what is the nature of the light action which makes it possible for the sensitive material sooner or later to "recover" from it?

Telephoto Lens.

I should be grateful for a brief explanation of the construction of a telephoto lens, especially what is called a fixed-focus telephoto. How and why is it used? F. F. (London.)

Originally a telephoto combination was generally a large-aperture "portrait" lens, behind which was a negative lens. The image from the former was received by the latter, and projected in a magnified form on to the plate. The separation of the two components could be varied, with the result that different degrees of magnification could be secured. This was a "variable-focus" telephoto, and was the equivalent of a series of long-focus lenses, for which less camera extension was required than for similar lenses of normal type.

In a fixed-focus telephoto the negative lens is fixed so as to give a magnification of about two times. This permanent separation enables better optical correction to be made, so that the lens may work at a relatively large aperture.

Such a lens is used to give a larger image from a given distance, and is used exactly the same as an ordinary lens of equivalent focal length. The *f*/ numbers have their indicated value.

System in Photography

System always sounds rather forbidding and difficult. In reality it is just the reverse, for it provides the only possible means of making work certain and easy by making all the routine part automatic.

THE advent of the miniature camera has done much to enforce system upon the photographer. The margin between success and failure with these small negatives is too narrow to permit of liberties being taken. It matters very much whether the exposure is correct, or nearly so. It is most important that the film should be developed for the right time, in a developer suited to the emulsion, and at the correct temperature. Systematic working, exactitude in the observation of detail, have definitely entered into the photographic scheme.

Handling the Camera.

It is only when systematic methods of working are adopted that the photographer can feel certain that his results will be satisfactory. He is free to devote all his attention to the subject, and this is in itself an advantage, no matter whether the subject is of a pictorial or a technical order.

Except in the case of a camera which is completely automatic in action, the user should accustom himself to manipulation of the apparatus in some definite order. For example, the focus may first be set, then the shutter, and then the stop, always in the same order. This means that if an unexpected subject suddenly appears the photographer will be more able to cope with it, for he will make the necessary adjustments almost automatically.

It is a good plan to carry the camera with the controls set at known positions. For example, we know of one worker who always carries his camera with the scale set at 20 ft., the shutter at 1/25th, and the stop at f/11. It is ready for a large variety of unexpected subjects. If time allows, further adjustment may be made, if necessary, without need to disturb what may be called constant factors.

A most important part of the photographer's personal system should be to wind the film or to change the plate immediately after exposure. We watched an experienced worker for some time at a sports meeting, and his fingers seemed to move from the shutter release to the winding mechanism as though it were all part of the same operation.

Systematic Exposure and Development.

It is safe to say that the best photographic work is now being done by those who have realised the importance of systematic methods of working. Perfect negatives can only result when the plate or film has had sufficient light action to produce an image in which the tone-values are correct, followed in turn

by development which will ensure a negative of the right contrast for the printing paper to be used.

The miniature camera user has this fact forced upon him. If his enlargements over many diameters are to be satisfactory, the negatives must be of the right quality for the purpose, and this can only be the case if systematic methods of working are adopted. And if at times the photographer makes an attempt at subjects which compel him to take chances, the best results will still be secured, because those methods which have been found to make the best negatives after careful exposure will also produce the most nearly perfect results in other cases.

System in the Dark-room.

The observance of system in the dark-room has the effect of making results more certain, and also effects a saving of time. Obviously, "a place for everything and everything in its place" should be the rule. A little planning will assist in ensuring this.

A slate with "things to be done" is a useful reminder of developers to be made up, materials or chemicals to be bought, or prints to be made on the next occasion printing is done. All this assists in saving time, and helps to make a few spare moments profitable. For example, printing will never be delayed because the stock of paper has run out, nor because the photographer has forgotten to replenish his supply of developer.

It is the custom of most photographers to use several grades of paper. Care should be taken to see that the papers are used up in the order of purchase. Fresh stock should always be placed at the back of the shelf or drawer so that the older material is used first, and the date of purchase should be pencilled on the packets in case they get mixed.

Most photographers use a fine-grain developer for several films. It is necessary to know how many times the solution has been used, or a batch of poor negatives may result from using an overworked or stale developer. Time slips by, and developers lose strength every day that they are kept in solution. A note of the time when the developer was made up, as well as how many films it has developed, may serve as a hint that it would be better to use fresh solution than chance the good behaviour of the old.

System and Economy.

The photographer who feels that his hobby is costing him more than it should will probably find that working in a systematic manner is the best means of reducing costs. The introduction of

system into photography should eliminate waste, which adds terribly to the cost of successful results. Every photographic plate or film and each sheet of printing paper is a possible perfect negative or print, and with systematic working will fulfil its promise.

The need for making several exposures upon each subject in order that one may be correct disappears with the use of the simplest of exposure meters. Systematic development ensures a good negative. Test exposures ensure the perfect prints. Systematic working will not only eliminate waste and ensure economic photography, but will also raise the technical standard.

Storage and Filing.

Every photographer must recognise the need for a system of storage which will protect his negatives and allow every one to be so placed that it may be found in a minimum of time. This is especially the case when large numbers of negatives are made.

The system adopted depends upon individual requirements, but, whatever it is, the point to be noted is that it is an essential that negatives should be dealt with as soon as dry. Filing should be regarded as much a part of negative-making as washing.

Finding a negative when it is wanted is made very much more easy and certain if there is available a rough print from each of them. These prints may be made, if desired, on a "commercial" grade of paper, and each should show the whole of the negative. Each should be marked (on face or back as is most convenient) with some distinguishing number corresponding to the negative from which it was made.

A secondary use for these rough prints is to regard them as guides for subsequent enlarging. The exact area which gives the best composition can be marked out on each in pencil, after which the work of setting up the enlarger to give the required result, if done with the rough print at hand, becomes a matter of moments only.

Miniature workers may prefer to make small enlargements—say postcard or half-postcard size—rather than contact prints, as the small size of the originals makes it difficult to mark off with any exactitude the boundaries required for the final enlargement.

In every single part of the photographic process, from making the exposure to turning out the finished enlargement, trouble, time and expense can be saved by that small amount of careful attention to detail that we dignify by the name of "system."

HAWTHORN. 1/10th sec., f/4.5, Ilford S.G. Pan. plate.

MANY photographers are so far carried away by the capacity of the modern miniature camera for producing perfect little negatives that they have abandoned old and trusty friends in the shape of more bulky cameras of an earlier pattern; but when the "shouting and the tumult" have died I fancy that they will realise that there is a place in their outfits for both.

Those who have started photography in the last few years may never have used any other camera than a Leica, Rolleiflex, etc., and it is mainly for them that I write the following.

I have a Kodak Duo Six-20 which I carry with me whenever possible. Along with this I use a $3\frac{1}{2} \times 2\frac{1}{2}$ double extension plate camera with f/4.5 lens of 10.5-cm. focus, which comes into action most frequently at home. There is, without doubt, a branch of photography with unlimited possibilities for which this type of camera is indispensable. A first-class specimen can be bought for from £5 to £10.

I do not say that the miniature *cannot* deal with real close-up work. It can. But to produce results equal to those obtainable with, say, a $3\frac{1}{2} \times 2\frac{1}{2}$ instrument such as mine, and which cost under £10, you would have to spend three or four times this amount. The average small camera used with a close-up attachment to the lens falls below the required standard.

The double extension is necessary for real close-up

REALLY

By
F. ALSOP PARTINGTON.

work, still life, portraiture, flower studies (both indoor and outdoor). Also the relatively small depth of focus of the lens centralises the interest and pulls the composition together, and suitably diffuses the background. The focussing screen helps greatly in arranging the composition.

There is a full choice of sensitive materials—plates, cut film, roll film or film pack. I prefer to use plates or cut film for they can be developed separately, a great convenience when making experiments. There is little need for super-sensitive materials, so I use mainly the medium-speed panchromatic variety. But in my opinion for this class of work there is no film quite so suitable as the soft-gradation plates, which give beautifully-graded negatives.

A really rigid tripod is essential, for exposures may be anything from 1/10th sec. to 30 secs., and a "universal head" attachment, which allows the camera to be tilted to any angle on a stationary

HALL TABLE. 1 sec., f/4.5, Kodak Panatomic.

CLOSE-UP

tripod, can be bought for a few shillings. This saves time and loss of temper.

The shallowness of depth of focus must not be under-estimated. At close range it may be necessary to stop down to $f/22$ sometimes to obtain sharpness over a field of only a few inches.

Avoid lighting which is too "fierce" and arrange a reflector to illuminate any deep shadows. A brilliant lighting very often pleases the eye but gives almost unprintable negatives.

Much of the charm of such subjects as flowers resides in the texture of their surface. A point to bear in mind in arranging the lighting is that textures are much better rendered by a plucky print of a softly-lighted subject than by a soft print of a brilliantly-lit subject, even though the total range of tones is about the same in both. And remember, too,

PEONY. $1/10$ th sec., $f/4.5$, S.G. Pan. plate.

POPPIES. 1 sec., $f/4.5$, S.G. Pan. plate.

that a texture is brought out more clearly by a glancing lighting than by one falling flat on the surface.

Allow full exposures and develop moderately. The aim should be to produce thin negatives with a full range of tones.

If by any chance contrast should turn out to be inadequate, which is not very likely, since the tendency is always to arrange for much too strong contrasts in the subject itself, it will not be of much consequence ;

there is always a contrasty or extra-contrasty printing paper which will save the situation and give a first-rate print.

Any mistake made in development, then, should be in the direction of under rather than over develop-

ment, and the developer chosen should be of the soft-working (high factor) type. Always remember that in work of this kind over-development and under-exposure are the only faults in technique that are almost impossible to remedy.

Although this branch of photography is particularly absorbing indoors, you will find that it is often profitable to take two cameras outdoors in summer, the large one being invaluable for flower studies, architectural detail and all kinds of close-up work.

CRAFTWORK. 15 secs., $f/22$, S.G. Pan. plate.

Readers' Hints, Tips and Gadgets

LENS HOOD AND FILTER-HOLDER.

ANY wireless "junk" merchant has a variety of old compressed paper coil-formers. Ascertain the outside diameter of your lens mount or hood and select a former having an internal diameter the same size or greater than this. If you cannot find one the right size to give a press fit the one having a larger diameter can be packed up to the required extent. Cut two rings off this $\frac{1}{8}$ or $\frac{3}{16}$ ths in. wide.

Now out of a piece of Bristol board cut two discs having a diameter equal to that of the outside of the former. These should have holes in them about $\frac{3}{8}$ or $\frac{1}{2}$ in. less in diameter than that of

the outside. An easy way to cut these out is to scrape them out with an old

pair of dividers, but be sure that you cut the outside diameter first.

Stick the filter between these two discs, so that they are all concentric; and when dry, stick one ring on each side, and bind the whole with gummed paper. This latter takes the strain off the glued joints, thus preventing the filter being pushed off the ring if it is roughly handled.

The whole of the article can now be painted a matt black with indian ink, giving it quite a businesslike appearance.

The cost? Roughly id., half an hour of labour and the price of the filter blank.
J. S. B. JOYCE.

DARK-ROOM WINDOW SHUTTERS.

DARK-ROOMS, especially if improvised, tend to become unpleasantly stuffy, heads grow thick and work is spoilt. This can often be avoided by using window shutters of the kind described below.

First make a frame of 2×1 in. wood to fit exactly into the outer frame of the window, using the wood edge-on. This must be made to fit exactly, and a little time spent in making it snug will be well repaid. Paint the inside only of the frame with flat black paint. Then cut two pieces of dark green window blind material each wide enough to cover the frame except for a 2-in. space at one side, allowing for a turnover of about an inch all round. Paint these on the side to be the inside with the black paint and tack them to the frame with the gaps at opposite ends. Along the edges tack doubled black cloth strips to ensure complete light-tightness between shutter

and window frame, and fit strong tabs or handles to enable the shutter to be pulled out easily.

The staggered gaps, while excluding light, keep up a slight circulation of air, which is sufficient to keep the atmosphere pleasant for much longer than if the windows were completely blocked up.

For this to be possible, the window behind the shutter must of course be open. Particular attention was drawn to the necessity of making the shutter a good tight fit to the window frame; if it is not, the whole erection is quite likely to blow down from its place on a windy day. Turnbuttons on the window frame, with recesses in the frame-work of the shutter to take them, will prevent this. Or a set of the bolts used at the corner of tennis-racket presses can be fixed to the window frame, with drilled plates to correspond on the shutter, which is held firmly in place with the wing nuts. Or, if your prefer, you can just shut the window.
C. B. HEATH.

A USEFUL TAPE MEASURE.

WITH a camera of the focussing type that has neither range-finder nor ground glass to focus on, one of the chief troubles when photographing near objects (i.e., round about 6 ft. and less) is of course measuring the distance, as one nearly always forgets to take a ruler or tape measure around with one.

I have found it most useful to mark off the strap of the camera-case in feet and half feet, as this is an article that is always at hand when photographing. Most of the camera cases supplied have a strap that can be unbuckled from the case itself, thus making a convenient and an efficient tape measure.
BASIL BUTCHER.

TITLING POST CARDS.

WHEN an amateur has to turn out fifty or more post cards of the same subject, the cards should have a white margin and should preferably have some kind of titling to provide the finished appearance seen in good commercial work.

Secure a post card printing-frame with glass, and position the group on this, leaving a narrow strip of foreground for the title. Leave the enlarger in position and note the position of the frame.

To make the title, take a piece of clear celluloid from a waste piece of film and print on it deeply the required title, using a small printing outfit with standard type. Dust the title with gold or silver powder whilst the ink is wet to ensure opacity in the lettering and brush off the excess.

The celluloid is then trimmed to a narrow panel and stuck on the glass of the frame with two small dabs of "Seccotine." When the post cards are developed, the title appears in white lettering in the foreground.
J. JONES.

"THE GHOST OF ELY PAYS US A VISIT"

We are the only firm in Great Britain specialising exclusively in the sale of miniature cameras and their accessories. The purchase of a new miniature camera from us secures for the purchaser an absolutely unparalleled after-sales service. And our stocks are the completest of all.

* * *

The following used cameras are typical of our immense range of second-hand bargains. Although the prices are noticeably lower than those asked elsewhere for similar instruments, every camera is tested and backed by our guarantee. The most generous part-exchange allowances are given, and hire purchase terms can be arranged over any period up to 24 months.

LEICAS :

Leica IIIa, f/2 Summar lens, ever-ready case. As new	£35 10 0

Super Ikonta 530/16, f/3.5 Tessar, Rapid Compur. As new	£17 19 6

GLOSTER: "My lord of Ely, when I was last in Holborn, "I saw good strawberries in your garden there; "I do beseech you, send for some of them."
(Shakespeare, "King Richard III.")

(Let us suppose a four hundred years' lapse of memory on Ely's part. He revisits Holborn in search of strawberries and then returns to the ghostly court of King Richard III to make his report.)

"My Lord, when I was come again to Holborn,
"Upon the spot where my sweet garden bloomed,
"Gone were the fayre and goodly flowered fields,
"And in their stead, sprouting from Hell's own bowells,
"A city most fantastical, whose wide streets
"(full of a mustiness and stinky exhalation)
"Shook, as if imprisoned in subterranean cave
"Where ghosts and shrieking demons fast shut up.
"Ranging the paven carriage-way I saw
"A cavalcade of frightening devilish inventions,
"Filling the quaking air above with sound
"Of earthquake and imminent cruell warre.
"Before my eyes whichever way they glanced
"Shonne out dispartckling lights,
"Which did obnubilate and put to shame
"The lusty sun itself.
"I must confess that overmuch provoked
"By many such wanton and unsavoury views
"Nigh came my eyes to gushing brinish tears;
"When there approached a yonkster merrie loute
"Who, clad in barbarous, queere and clownish garb,
"Asked what I lacked, and when I replied
"I came to gather strawberries, laughed in my face
"Like any rudesby knavish oaf, or dolt,
"Crying, 'Good sir, here grow no strawberries,
"But what's e'en better here stands
"The finest shop in all this cheerval universe,
"For littel cameras, clever, comelie thynges,
"Which of these latter days do all men prayse,
"And greatly do desire.' Dear my Lord Gloster,
"I prithee, good my Lord, if strawbernes are no more,
"Will'st thou then take these new-found camera conceits
"These littel cameras from my garden of Holborn?"

MINIATURE FILM PROCESSING IN CHAMPLIN 15

Try the experiment of sending us your next film for processing in Champlin 15. We are the only people exclusively engaged in miniature processing, and the experience gained in three years' intensive specialisation is reflected in the results. Of course, we use other developers, but Champlin 15 seems to us just the most scientifically worked out formula yet available. By the way, subsequent treatment of negatives with Scratchproof is no new thing with us. This has always been a feature of our special processing service. The prices for Champlin 15 development are 3s. for ordinary miniature spools and 3s. 9d. for Leica films. Ordinary fine-grain development costs, of course, only 9d. and 1s. 6d. respectively.

NOTE. Champlin 15—the authentic American formula may now be had from us in the form of a concentrated solution requiring only the addition of water for use. Price per bottle, to make 20 oz. of developer, 4s. 9d., postage 6d.

MINIATURE CAMERAS FITTED WITH COUPLED RANGE-FINDERS (contd.):

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

Come into the Garden

By F. READ.

IF charity begins at home so also does photography, yet some pictorial photographers seem strangely unaware that the home and, more particularly, the garden, is a happy hunting-ground for pictures.

A sunny day in the garden can often be just as profitable as a day away from home, and some of my favourite prints have been secured with no more ado than finding myself on the back door-step and remembering that the summer is slipping by and it is high time I tried for my exhibition pictures.

Garden photography is really too easy for words. One need not worry even if there is a film in the camera or not—for if there isn't what harm is done? Just trot inside and put one in. And if your filter is not in your pocket it is sure to be on the mantelpiece, or the wireless set—or somewhere.

And subjects? You do not have to worry what will turn up in the next hour or so. You know that in July the roses always bloom on the

pergola—and if you miss them owing to a rainy spell they will bloom again (with a complete disregard of passing years) next July. If you are a gardener as well as a photographer you will revel in this flower photography (it's

A LAZY AFTERNOON.

The garden also is the ideal place for photographing children. Even if you have none your neighbour will have, and I'll guarantee will loan them without interest if you indicate "Photographic Purposes."

It should be remembered that the close proximity of house walls, trees and hedges often cuts down the amount of light available, and a fairly generous exposure or a fast film is advisable.

A GARDEN PORTRAIT.

almost illimitable), and even vegetables or your blister-raising garden tools might with a little ingenuity be made to form an interesting composition.

The garden, too, is a place where things happen. Washing-day is always interesting, especially if there are some good clouds about.

On a fine day, too, tea in the garden is not only a necessary tribute to the health-giving sun (providing incidentally a little exercise in the matter of wasp-dodging), but another opportunity for a picture, especially if some friends come along to liven things up.

THE HOUSE—MODERN VERSION.

WASHING-DAY.

Note the use of a filter to make the sunlit clothes show up against the sky.

A Template for an Adapted Camera

By
GEORGE L. WAKEFIELD.

HERE is a handy gadget for the amateur who, for the sake of economy, has fitted his camera with a mask to take 35-mm. films, as suggested in an article in *The Amateur Photographer* dated August 4th. When winding up the smaller film with a specially numbered backing paper, it is difficult to ensure the film being exactly in the centre of the paper, especially when using panchromatic stock, which must be handled in total darkness.

Cut a template from thin card to the specifications shown in the sketch. When winding up a film, proceed as follows: Thread the end of the backing paper through the wide slot,

with the black side facing the smaller slot. Attach the end of the paper to the spool, which for convenience should be fitted into the take-up chamber of the camera. Wind up

the paper to the word "stop," thread the end of the film through the narrow slot, and attach the end to the backing paper with a strip of adhesive tape. The cut-away portion of the film slot prevents the emulsion being scratched by the edge of the card.

Wind film and paper together, and attach the other end of the film, also with adhesive tape. The remainder of the paper can now be wound on the spool, and the result is a daylight-loading 35-mm. film.

This device is particularly useful where it is desired to use the new 35-mm. colour films, which, as yet, are only available to the fortunate owners of small cameras.

Making Outsize Enlargements

By
D. E. LUMB STREET.

THOSE of us who only occasionally make really large prints often do not possess the necessary dishes, and the problem faces us as to how to process large sheets.

Swab development is a method that comes to the rescue on these occasions, and in addition it is valuable for local development and for simultaneous developing and printing.

The method is as follows: The exposed sheet of bromide paper is placed on a pad of newspaper which has been damped, and is itself well swabbed over with a tuft of cotton-wool, or soft white rag, saturated with water. It will then adhere to the newspaper. A fresh solution of M.Q. developer, preferably a formula containing potassium metabisulphite, or even acid amidol, is then applied with the swab. Plenty of solution must be used, sweeping back and forth over the paper, otherwise uneven development will result.

Local development can also be undertaken by this method when once sufficient all-over image has appeared. In this connection it is often an advantage to localise the solution still further, and this can be achieved by mixing with the developer while still warm about one ounce of glycerine to five of developer. This, while not impeding the action, helps the developer to "stay put" where it is required.

When the print is sufficiently developed it is held quickly under a tap or rinsed in a large household vessel, and again swabbed, on the newspaper, with a stop-bath, consisting of 1 oz. potassium metabisulphite in 1 pint of water.

Fixation can be carried out in like manner, but if possible

it is better, and a good deal less tedious, to fix the print, loosely rolled, in a large household bowl. The paper is frequently unrolled and re-rolled, in order to ensure that the whole surface gets its fair share of the fixer. A longer time than usual is necessary by this method, and it is essential that the fixer is fresh and acid. Since hypo keeps and is cheap, there is every advantage in making up a good quantity for use in, say, the domestic basin, thus ensuring that all or most of the rolled print is covered at one time.

The swab method can be used successfully for local reduction, if such should be necessary, but in this case the print should be little more than damp, surplus moisture being mopped off, and the tuft of wool only lightly charged with solution.

It is sometimes convenient, as for example when printing in clouds, to see the image develop as printing progresses. The paper again in this case is thoroughly swabbed with developer, which in this case also can advantageously be doped with glycerine, and then affixed to the enlarging easel. Printing is then begun, and while it is proceeding the surface is replenished frequently, either wholly or locally as required, by fresh solution applied with a tuft of cotton-wool in a loop of stiff wire.

This scheme, besides affording a high degree of control, will also, by doing two jobs at once, cut down the time and effort of making a big print. The latter reason, of course, is not a valid one to the serious photographer, and, while the method is very useful on occasion, it must be remembered that when size permits, normal dish development is the best way.

A Binder for "Miniature Notes"

THE four-page "Miniature Notes" section of "The A.P." is, in my opinion, a source of information into which it is worth while to delve again and again for practical ideas and reliable data. The whole section can be permanently preserved in the following simple manner.

Get from your stationer a spring-back binder, specifying "large quarto upright" size. Most good stationers keep this size in stock—if not, they can procure one to order—at about 1s. 6d. This binder will hold over a hundred of the four-page sections quite securely. By using the following method the usual width of the centre margin can be retained.

Take the copies you have at

An ordinary spring-back binder, as sold quite cheaply for office use, serves well for binding pages of "The A.P."

hand, open at the centre pages, and lift the wire staples. Remove the two double sheets entirely. Then cut along the edge of the centre margin close to the printed matter on the opposite pages. Extreme accuracy is not necessary. All that is needed is a margin of at least half an inch beyond the centre line.

Now open the binder and extract the manilla folder which is supplied with all makes. Collate the sections by date, press the wide margin flat, and tap the wad of leaves lightly on top and front edges. Lay the wad on the back sheet of the folder, square the edges, close the folder, and insert it in the binder. The binder will now open flat for reading.

S. W. JARVIS.

Modern Miniature Cameras

THE ALTIFLEX.

THE Altiflex is one of the latest additions to the growing family of moderately-priced twin-lens reflex cameras taking 12 pictures, each 6×6 cm. (2½ in. square) on a standard 8-exposure 3½×2½ roll film. Complete with its neck-strap and with a film in place, it weighs but 23 oz. It is thus one of the lightest of the twin-lens reflexes. Nor is it unduly large; its dimensions are 5×3½×3½ in. over all projections.

The lenses fitted to the model sent for review were both Rodenstock Trinar, of focal length 7.5 cm. and aperture f/3.5, the taking lens being mounted in a Compur mechanical shutter speeded to 1/300th sec., and not fitted with delayed action. As is usual in this type of camera, no iris diaphragm is fitted to the finder lens.

The camera has fixed extension and focussing is done by rotation of the front cells of the two lenses. These cells are connected by a link motion, actuated by a lever projecting from the left-hand side of the camera. The travel of the end of the lever is approximately equal to the distance between the centres of the two lenses, so that focussing is not in any way coarse. A focussing scale is fitted beside the taking lens and is graduated to five feet. For photographs at shorter range than this a supplementary lens would be required.

The focussing hood is a four-fold one of metal, the three remaining sides springing up into place when the cover is lifted. The side next the user carries a focussing magnifier which in its folded-away position lies outside the hood, and so is very easy to swing into place when required. Without it, the image as a whole can be viewed in comfort, but for the accurate focussing required on these comparatively small negatives the magnifier is needed, as in other cameras, by any person of normal eyesight.

Setting the Shutter.

The camera is convenient to handle, except for one small point: the setting-lever of the shutter is decidedly awkward to get at. It has to be pushed back into the space between the shutter casing and the viewing lens, which is too narrow to admit comfortably even the little finger.

This fault could quite easily be avoided by turning the shutter so as to bring the release lever to the bottom instead of the side; the setting-lever would then be quite clear of all obstructions.

To load the camera the sides, back and bottom take off in one piece, giving the fullest possible access to the interior. The take-up spool is dropped in from the side of the camera; as the winder remains in the case we found it convenient to wind up the first turn or two of paper with the aid of a coin slipped into the slot of the spool.

The Exposure Counter.

Film advance is by a simple form of counter-dial. The winder is turned until the first number appears in the red window, when a numbered disc behind the winding knob is turned to bring the figure 1 opposite a white dot on the knob. Subsequent advance of the film is done by bringing this dot opposite to the successive figures on the dial. We found this both quick and convenient.

A test film showed that the lens, even at full aperture, gave extremely good definition, and that the coupling of finder and taking lens was accurate, the point focussed on the screen being rendered sharpest on the negative. The twelve negatives were correctly spaced on the film.

The Altiflex is available with Ludwig Victor f/4.5 lenses, or with Trinar lenses of aperture either f/4.5 or f/3.5, the prices with Prontor II shutter, speeded 1 to 1/175th sec., being respectively £7 9s. 6d., £7 19s. 6d. and £9 5s. With Compur shutter it costs about a guinea more in each case. The camera can be had from any dealer, or from the sole distributor, Mr. R. E. Schneider, 46, Farringdon Street, E.C.4.

Miniature Camera Gossip

By LANCELOT VINING.

LAST week I published two photographs taken with different 7½-in. lenses on my Contax and stated that I did not think either could beat the results obtained with my 5½-in. Sonnar. During the past week I have been able to test all three on the same subject and my verdict remains as before. The definition of the 5½-in. lens at f/4 is so crisp that it will stand great enlargement, especially when the new F film is the sensitive medium.

Wait Awhile.

All my correspondence this week has been about synchronised Speedguns, so it looks as if there is going to be quite a demand for them. I am surprised that some dealer has not taken them under his wing, as at the moment they can only be obtained in New York.

My advice to would-be buyers is to wait a few weeks, as I have another type, called the "Kalart Speed Flash," coming over from the States for a trial; I have seen the Leica model in action and

CARDINI'S ONE-HAND SHUFFLE.
Agfa F film, 1/1,250th sec., Speedgun at 3 ft.

his latest one-handed shuffle, so quick that the eye could not follow it. I doubted if the cards were being properly shuffled, and asked to be allowed to photograph the operation at 1/1,250th. He agreed to this, and I give you the result, which shows that the cards are certainly being shuffled, and pretty thoroughly too.

Seeing Rats.

The late nights at the Zoo have always interested me, although they have provided me with a large number of photographic failures; I am often to be found there just "messing about," but last Wednesday I went there with the fixed intention of getting a diving sea-lion.

I was at 30 ft., inside the enclosure, and giving 1/500th, so opened up to f/2.8. This proved not to be enough, probably because there was nothing in the subject or be-

RUSS CAR WITH OLIVE GREY. 5½-in. Sonnar, 1/25th at f/4, I.S.S.

it worked perfectly, and, moreover, it is very small and compact, and can be easily carried in the coat pocket.

I have been asked many times about the lamps required; both the apparatus require to be used in conjunction with the Philips lamp.

Fast Work.

I met Cardini, the card wizard, at the London Palladium, and he showed me

yond to reflect back any of the light. Next Wednesday I shall open up to f/2 and f/1.5. Picture next week (perhaps).

Two things were impressed on me during the evening; the rats in the sea-lions' enclosure are the largest I have ever seen, and the keeper on duty on Wednesday nights can throw fish better than his colleague on Thursdays; this is just in case any of my readers are thinking of trying their luck.

TEN GUINEAS AND UNDER

A Section for the User of the
Inexpensive Miniature.

The Twin-Lens on Holiday By D. J. GREGSON.

LIKE most people I do the bulk of my photography during holidays, and I like to return home with a complete record stored away in those neat rolls of film. I try to ignore all the "obvious" views and to concentrate on the less obvious which are often more attractive.

Piers and breakwaters are good vantage-points, and by shooting down I obtained the pleasingly "different," but not freakish, picture of "Low

GLITTERING WATERS.

Tide" at Mullion Cove, Cornwall.

I like to take photographs against the light, and find this very effective with shipping subjects, which I print rather deeply to obtain a semi-silhouette effect. The two examples reproduced herewith were taken at about 7 p.m. in July and given an exposure of 1/50th sec. at f/8. Needless to say, the lens should be carefully shaded from the direct rays of the sun.

Some photographs of the local inhabitants at work are always included in my holiday "bag," but one has to be careful to avoid any suggestion of pose. With my twin-lens reflex I do this by holding the camera sideways, and I have found that few people notice the lens pointing at them if the photographer is facing another way.

I adopted this manœuvre to obtain "Crabs." The fisherman would persist in posing, rather awkwardly, with a huge crab held out in front of him, but when I turned sideways and

CRABS.

pretended to be interested in something else he went on with his work without noticing that the lens was still pointing at him.

I don't think it wise to try and hide the camera. Let them see that you are hiding a camera with the object of catching them unawares, and you may as well "pack up," for they will watch you very carefully and adopt a pose as soon as they think you are going to "fire." The best thing is to use the dodge mentioned above; or to have patience, wait until they get on with their work, and fire away.

In this way it is generally not difficult to obtain convincingly natural poses.

TO ANCHOR.

LOW TIDE.

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

EFFECTS OF FOCAL LENGTH.

Some miniature cameras can take lenses of different focus, and I understand they make the picture bigger. Do they take in the same amount of picture or less? And what is the least shutter speed that can be given, in the hand, with a 11.5-cm. and a 40-cm. lens? Z. M. Q. (Ahmedabad.)

The size of the image of any object at a fixed distance is exactly proportional to the focal length of the lens used for taking the photograph. If a house gives an image an inch high when taken with a two-inch lens, a photograph from the same spot with a four-inch lens will show the house two inches high. The amount of picture included depends on the size of film with which the lens is used.

The longest exposure that can be given in the hand with lenses of long focal length depends so much on the individual user's ability to hold the camera still, and on the standard of definition demanded on the negative, that we cannot usefully give you any figures in this connection.

FAULTY ENLARGEMENTS.

I enclose some 3½ x 2½ enlargements from miniature negatives made on a fast panchromatic film. Some of these show very bad grain in spite of their small size; and, in addition, many of the prints are very hazy. Why is this? And what are the vertical stripes on some of them? W. J. (London.)

We were very surprised indeed to see the amount of grain that has appeared on some of your 3½ x 2½ enlargements. We have made, from the same film, whole-plate enlargements which have shown very considerably less grain than these small prints, though, admittedly, in our case we were using a fine-grain developer. We are inclined to think that your films must have been developed in a very warm developer, and probably one totally unsuited to the film.

As to the other faults mentioned, the haziness of which you complain might be due to wrong exposure, wrong development, careless printing, or any one of a dozen other causes. From the appearance of the prints, we think under-exposure the most likely. The vertical stripes are scratches on the film, and naturally we cannot attempt to say whether these were made in the camera, during development, or after the film was dried.

A CONVERTED ENLARGER.

In converting my 3½ x 2½ enlarger to take Leica-size negatives I fitted to it the Elmar 5-cm. lens from my camera, and now find I cannot obtain an image much larger than the negative itself. Ought I to have fitted smaller condensers at the time I changed the lens? A. G. H. G. (Twickenham.)

The reason that you fail to get any but small images in your converted enlarger is that the lens is too far from the negative. You will have to find means of supporting the lens at a distance which is barely more than the distance between the lens and film in the Leica camera itself. This will give you a high degree of enlargement, which can be reduced by increasing the extension beyond this minimum. The condenser does not in any way control the image produced; its use is connected only with obtaining even illumination of the negative.

LEICAS WITHOUT RANGE-FINDER.

I often see advertisements of Model I Leica cameras second-hand. Are these the same as the Standard Leica as described in the catalogues, or is it an obsolete model? K. D. B. (Swansea.)

The Leica Model I is an earlier model than the Standard Leica, and most are not fitted to take interchangeable lenses. Apart from this, the difference between the two consists for all practical purposes in the fact that the Model I is much less readily converted to a Model II or Model III Leica than is the Standard model, which has been designed with a view to subsequent conversion if desired. You realise, we think, that neither the Model I nor the Standard Leica is equipped with a coupled range-finder.

MAKER'S NAME.

I have just bought a second-hand Leicameter Model 617, but I have no instruction book for it. Can you tell me where I could get one? R. T. R. (Westcliff-on-Sea.)

The Leicameter is made by the Weston Electrical Instrument Co., Ltd., of Kingston By-Pass, Surbiton, Surrey, and if you apply to them you will doubtless be able to get an instruction book for its use.

how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CDII.

Mr. A. R.
ELLIOTT.

From information communicated to our Special Representative.

"MY first camera, a No. 0 Brownie, was presented to me when I was seven. Development of the first film proved exciting. The dark-room lamp, in common with other war-time illumination, was uncommonly dim; as a result I see-sawed the backing-paper for some five minutes without effect. After trying the creamy-coloured stiff material lying on the floor, things began to take shape.

"Having progressed a little since that time, I have sampled plates, cut films and roll films, and now find myself using exclusively Panatomic roll film. This was formerly developed in D.76, and since its introduction, in Meritol, using a

daylight-loading tank. An electric exposure meter is used, and I prefer to regard development as a strictly controlled chemical process, rather than introduce the hit-or-miss personal element. A fine-grain soft negative is thus obtained, suitable for the diffused light condenser enlarger.

"The camera I have had for the last two years is a 16-on- $3\frac{1}{4} \times 2\frac{1}{4}$ Super Ikonta, with the Compur Rapid shutter. This semi-miniature is sufficiently small and light to be carried with ease in the pocket, and is capable of tackling most subjects. Nevertheless, I envy the 35-mm. users their interchangeable lenses.

"Contact prints are made of all negatives, any likely-looking ones being enlarged on 7×5 glossy paper. The final shape is decided from these bromides, and the finished picture made on 12×10 bromide. I frequently find that the test pieces given do not yield the same result as the large sheets; whenever the print will not be precisely 12×10 , I trim to the final shape before exposure, and use the trimmings for making the test exposures.

"Subjects of any description appeal to me provided there is plenty of sunshine in them; but I find difficulty in recording the brilliance to my own satisfaction every time. Shots which should turn out perfect are frequently useless, and I have evolved no formula to make certain of success. Four years ago I dabbled in sub-standard cinematography, and of the films then made the outstanding impression I have is their luminosity. I regret my inability to get this sparkle into my still photography. Though it may not find general agreement, I make considerable use of relatively strong contrast filters.

"Much decried in some quarters, 'new-angle' shots appeal to me; so long as they are not too eccentric the results are pleasing to my eye, and I have attempted many.

"Competition work I find a great incentive. An invitation to join a postal club on its formation a year ago was accepted; the scathing remarks of the members, coupled with 'The A.P.' criticisms, are found to be of much help."

(A further example of Mr. Elliott's work is reproduced on one of the centre Art pages.)

O.K. FOR SOUND.

A. R. Elliott.

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"HOLIDAYS," by F. Rooke.

SIMPLE as the elements of this picture appear to be, they are yet admirably put together, and not a little in the way of foresight and ingenuity must have been exercised to get them exactly as they are. In choice of subject, there does not seem to be anything out of the ordinary—the theme is one which might just as well have occurred to the novice—and it does not amount to anything but an outdoor portrait showing a child sitting on the limb of a tree.

But, apart from a slight impression of discomfort on the part of the model—not altogether inappropriate having regard to her seating accommodation—the treatment seems just about right in every particular. The model herself is caught with a most engaging expression; she is perfectly in focus, and her figure and features are decisively defined; she is beautifully displayed against an even-toned background of sky, which, it will be noted, has a depth that is greater than the lighter tones of the figure and yet is lighter than its shadow tones; she is well isolated and the twigs of the far tree are not allowed to encroach upon, although they approach, her head; and the dark mass of the tree bole, its foliage above, and branch along the base have a sort of framing effect and enormously enhance the attraction of the figure they enclose.

Moreover, the child is very well placed in the picture space, and from the technical standpoint there is no occasion for adverse criticism, the print being remarkable for its harmony of tone and the strong but soft transitions from value to value.

It differs, however, from the effort of a beginner not only in these respects, but by reason of the fact that they seem to be incorporated by deliberate design, and the whole thing shows a competence and craftsmanship that, only by the greatest of flukes, could be achieved by a novice. I do not suppose for one moment that the way

in which the figure is defined is attributable to anything but a precision in focussing or in judging the distance, either visually or by means of a range-finder, that a newcomer to photography would seldom trouble to exercise, even if he were aware of the need, and, if he were, it is by no means unlikely that something, possibly unfamiliarity with his instrument, a failure to verify its registration, or movement of the camera at the

"come" so well against the sky. It might have happened that the legs and lower part of the body came against the landscape which now lies along the base of the picture. In that event, it would not stand out so effectively, and, in just the same sort of way, a lower viewpoint would have brought the twigs and head into contact, so that, in place of the clear space between them as now displayed, the twigs would seem as though they grew out of the model's head. I do not think I need labour the ill effect of such a *contre-temps*, but it is a thing that most beginners overlook and they only seem to gather it after their attention has been drawn to it time and time again.

And again, it is extremely doubtful if any beginner would have appreciated the value of the framing effect of the trees and their branches. This, I should say, shows foresight and a measure of design that could only be regarded as intentional. The emphasis it confers upon the figure, as the centre of interest, is too pronounced to be entirely fortuitous, and, whether instinctively or consciously incorporated, it betrays a sense of selection that could scarcely be acquired without a good deal of previous experience.

Then, too, the actual placing of the figure discloses a knowledge of the rule of composition which decrees that the points of intersection formed by divisions of vertical and horizontal thirds are suitable positions for the centre of interest. A considerable accession of strength is consequently attained.

A further indication of competence is to be seen in the way the expression has been so favourably caught without any offsetting deficiency in other directions. It is a very finished and workmanlike effort, and, behind its apparent simplicity and directness of statement, there lies a measure of contrivance and calculated design that only experience could confer.

"MENTOR."

moment of exposure, would intervene to prevent such a decisive rendering.

At least, that is what I find is at fault with many of the things that are brought to me with the complaint that the definition is not what it ought to be, and too often the defect is attributed to the lens, the camera, or even the material, when, in nine cases out of ten, a mistake in manipulation is the cause.

A similar degree of care has been extended to the placing of the figure. Had the camera been held but a trifle higher, the figure would not have

PICTURES by Novices

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page.

NO. 2 of the prints reproduced on the opposite page—"Crossing the Bridge," by J. Butler-Kearney—contains a well-caught group, but the depth of tone in the setting is disappointing, for it does not show up the figures to advantage and the arrangement would have been decidedly better had the figure to the left been shown somewhat nearer to hand than the donkey and cart.

A Question of Precedence.

The human kingdom, whether rightly or not, is supposed to take precedence over that of the animal, but, here, the order is reversed, and the impression is not altogether happy.

It is recognised, of course, that things do not always arrange themselves just as we would wish, but it is better, if at all possible, to show a human figure in advance, and, supposing that the figure, here, could have been placed ahead of the other elements, the impression would have been vastly improved. That it did not happen so, I feel, is a bit unfortunate, and the question then arises as to whether it would not have been wiser—having regard, also, to the gloomy nature of the setting—to have left the subject alone for the time being with the idea of returning when the light was more favourable.

Avoiding Gloom.

From which, no doubt, it will be inferred that my impression is that the dark of the setting is mainly attributable to the direction of the lighting, and not so much—although it may be present—to under-exposure of the negative.

A more liberal exposure, somewhere in the neighbourhood of six to eight times that given, would probably raise the tone of the background in relation to the rest, provided that steps were taken to minimise the contrast by reducing the time of development, but I do not think it would be enough to matter, and, in such circumstances, retaking seems to be the only alternative.

To Expose or Not.

On the other hand, there are the figures to be considered. It may be that they are few and far between, in which event it would be wise to get them

while the going was good, or, if they occur at frequent intervals, the chances are in favour of retaking, but, in the end, it amounts to this—that an individual judgment must be exercised and a decision taken according to the exigencies of each particular case.

A somewhat similar state of affairs obtains in No. 6, "The Road Home," by T. C. Parker, but, in this instance, there is a slight advantage in the way the figures are disposed, inasmuch as the donkey and cart are rather weakly placed near the left-hand edge, and the principal figures have a much stronger position nearer the centre.

The group, however, has not the coherence of that in No. 2, for the figures are more detached and their attitudes are inclined to be ungainly. The presumption, here, is that figures would be passing at fairly frequent intervals, and, that being so, it is probable that a much better arrangement might have been secured by a more careful selection.

Subjects with Figures.

No. 3, "St. Lazare," by F. N. Mills, suffers not a little from its excess of contrast—a softer grade of paper is indicated—but, with the exception of the nearest figure on the right, the spacing is very well arranged.

The figure in question seems mixed up with the one immediately behind and it is difficult to distinguish the one from the other. If its outline were just a bit more clear of the other, as it would be if the rear figure were placed rather more to the left, the spacing would be excellent, but, dealing with figures such as these, the moment for exposure has to be so precisely judged and the positions change so rapidly that it is no wonder that results seldom come up to expectations.

The depth of tone in the archway and the nearer set of figures seems to indicate that a fuller exposure would have been desirable, and similar remarks apply, again, to No. 4, "Der Klingentor," by D. R. Miller. A measure of over-development, too, is to be inferred from the excess of contrast, and, as in the former case, a softer grade of paper should give a more harmonious rendering. The sub-

ject shows a good idea of arrangement, but, as is the case with most street scenes, a well-placed figure or group of figures seems desirable in order to give it a semblance of vitality.

Printing Depth.

With a nocturne like No. 5, "Jewel," by J. L. Murdoch, a greater depth of printing than normal is permissible. The contrast, too, may be extended without impairing the realism of the rendering of night conditions, but, in this instance, the large area of solid black at the base seems to shout for explanation, and the whole would achieve a far greater measure of attraction if something like three-quarters of an inch were trimmed from the base.

But there is not the excuse of an abnormal subject in a thing like No. 7, "The Visiting Warship," by R. E. Peachey. It is, quite frankly, a good deal over-printed, and I do not think it much use to attempt to gloss over so obvious a misjudgment. It must have been perfectly clear, before development of the print was completed, that it was very much overdone, and the only thing to be done with such efforts is to drop them in the W.P.B. and try again with a reduced exposure.

The opposite appears to be the case with No. 1, "Marine Lake," by A. Webb, but, besides under-printing, the negative seems to lack the degree of contrast necessary to give a full range of tone on the printing paper employed.

Negatives and Prints.

This is a case, I feel, where a paper of more vigorous characteristics might have been used, or, alternatively, the negative might have been developed for a longer time so that its range was more extended and more suitable for the paper that was actually chosen. The present version is rather dull.

At present, the impression is lacking in vigour and punch, and the change of paper might be expected to correct that deficiency. The subject matter, however, presents little of pictorial interest, and, unless it was taken for topographical reasons or as a memento of a holiday visit, there does not seem much reason for its perpetration.

"MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE
LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

PHOTOGRAPHS IN SERIES.

TO the issue of August 18th, Mr. J. P. Munn contributed a very interesting illustrated article on compiling a series of photographs of some particular incident. Although this article is so recent there is no reason why I should not second Mr. Munn's proposition; and I may even succeed in helping to get it carried into effect still more widely. I hold that any suggestion is valuable that will lead beginners to realise that there is something else to be done with a camera besides taking unconsidered and pointless snapshots of each other.

Of course the idea of series photographs is not new. Some of us remember a very popular magazine that published a long run of portraits of celebrities at different ages. They added one more to many reasons I have for being thankful that I am not a celebrity. Most of Shakespeare's "Seven Ages" are not exactly attractive figures; and we do not like to broadcast the fact that at one end of our life we are slobbering brats, and at the other senile pantaloons, with nothing much to boast of in between.

But there are other kinds of series. Mr. Munn showed how delightful a kiddy can be in the ice-cream season—and out of it. This sort of thing is well worth doing, and I hope that many beginners will take notice of the fact.

I remember a very early series of my own, showing the passing of a barge through a lock. I sent them to an

Fig. 1.

editor, who, long after I had forgotten them, published them on a very small scale, with my name all wrong, and paid me nothing for them. I do not dispute his valuation.

And here I was, only the other day, at it again with a lock incident. I took half a dozen altogether, including the punt by the bank, and a good close-up of the paddler. Fig. 1 is the punt hanging on to the stern of the barge; Fig. 2 being towed in; and Fig. 3 in the lock. The three together are more interesting than any one of them singly.

For the benefit of those who like looking for trouble I may add that from one print I have eliminated a man—not a mere speck either, but $1\frac{1}{4}$ in. high in the original.

By the way, I took that Windsor-Henley trip again in the hope of better luck. One way it rained so incessantly that I did not take the camera out of its case; the other way I made forty exposures. I showed the results to two very old hands at photography, and they both agreed with my suggestion that the tone values and skies unmistakably indicated panchromatic material and a filter. Then at considerable personal risk I informed them that I was using ordinary films, and had not had a chance of putting on a filter. They pointed out thereupon that my results might have been much better, which I already knew.

But about those series.

Mr. Munn pointed out that sometimes we can arrange and stage-manage them ourselves

Fig. 2.

—a very interesting job. At other times, as with my illustrations, an incident or episode is entirely outside our control; we watch its progress, and decide on appropriate stages for making exposures. We should keep on the generous side, and afterwards edit the series so as to get the most expressive sequence possible. It is the sort of thing our ciné friends are constantly doing.

There are countless instances in which the incident unfolds itself continuously, so that we get our complete series in quite a short time, such as launching a ship, unveiling a memorial, or playing a game of bowls. Anything that is good for a short run of ciné film is suitable for our less complete but still interesting series.

Another familiar field is that of a garden or landscape at different seasons, and under varying conditions of light, and atmosphere; or urban subjects by day and night, etc.

These are naturally spread over a longer period, as are many more or less technical and scientific subjects, such as the growth of a plant or a building, the metamorphoses of insects, and so on. Many of our "nature" friends have shown us how admirably some of these things can be done, although I am afraid most of us lack their knowledge and patience.

Then there are tragic series showing all too clearly the destruction of the countryside, and the disfigurement of natural beauty. Fortunately, there are also complementary sets illustrating progressive improvements, the replacement

Fig. 3.

of ugly and insanitary buildings by something beautiful and better in every way. In all sorts of things action and change are constant, and from their results and effects we can make our series of records.

Some such aim in our work invests it with purpose and added interest. Further, it will make us less of a terror to our friends when we invite them to look at our photographs.

W. L. F. W.

"THE A.P." *Special Competition for Novices*

THIS competition is specially for Novices, that is to say, those amateur photographers who have never won an award of any description in a photographic competition, and preferably those who are only just starting photography.

The prizes will be awarded for the best snapshots of subjects that the beginner usually attempts. These include snapshots of the family, groups or single figures taken at home or on holiday, either indoors or outdoors, and landscape and beach scenes, etc., with figures. The arrangement of the subject and the pose of the figure or groups is a matter left entirely to the discretion of the competitor.

The entries will be restricted to contact prints and enlargements of standard "Enprint" size, which do not exceed $4\frac{1}{4} \times 3\frac{1}{4}$ in., even if made from the whole negative. These may be mounted if preferred, and the smallness of any print will not affect its careful consideration in this competition. The rules are very simple, but should be read carefully.

THE PRIZES.

The prizes in this competition will consist of supplies of roll film or plates (for those winners who happen to use a plate camera), as follows:—

The First Prize will be TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.

The Second Prize will be TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.

The Third Prize will be ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.

Twelve Prizes of ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

RULES.

Each print must have affixed firmly to the back a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor. The latest date for receiving entries is September 30th.

The copyright of all prints entered remains the property of the authors of the photographs, but the right is reserved by "The A.P." to reproduce the winning prints and any others that may be worthy of mention. The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed to: The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices' Competition."

MAKING BETTER SNAPSHOTS-14

By DAVID CHARLES.

This article is the fourteenth of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

INDOOR portraiture by the light from ordinary windows is not the easiest of arts, especially if it is to be done without the knowledge or assistance of the subject. One of the main difficulties is the lack of light on the shadow side of the face, which tends to come out black, or nearly so.

If the room is on the corner of the house, with windows in two walls, the lighting is usually more or less satisfactory, but in a room with only one window a reflector, consisting of a white sheet thrown over a screen or towel-horse, is essential to lighten the shadows. With a child as unconscious model, an excuse about "putting the sheet to air" will probably allay any suspicions that photography is contemplated.

Even with the child absorbed in some piece of work or play, unposed indoor portraits are not easy. With the brightest midsummer light, $1/25$ th sec. at $f/4.5$ might perhaps just do,

Fig. 1. (Right.) Against the light indoors is seldom successful.

Fig. 2. (Left.) A momentary expression perpetuated looks unnatural.

Fig. 3. (Below.) With the light concentrated on her, she stands out well against the background. The composition, too, is good.

but something like half a second is more usually required. With the camera on a table, or even on the arm of the arm-chair in which the photographer is sitting, camera shake need not be feared if care is taken in releasing the shutter.

One of the first things to learn is that contrast in the finished print will be much greater than it appeared to the eye at the time of taking the picture; the eye sees into dark shadows better far than the camera can. Try to get the lighting more or less even over the subject, with no strong shadows; it is almost impossible to get a lighting that is too flat.

Against-the-light pictures indoors—the most contrasty type of all—are extremely difficult to take successfully, as Fig. 1 shows. The shadow side is under-exposed, and stray light finding its way into these shadows has caused "glare" giving the result a grey and foggy look.

From the other side of the child things are much better. Most of the light is behind the camera, which now sees the brighter side of the face. The preoccupied little artist puts on a comically quizzical expression, and Fig. 2 is made. But it is quite unsuccessful. These momentary expressions are pleasing to the eye, but in a print they are very seldom acceptable. Their attraction seems to lie

in the fact that they *are* momentary, so that to make them permanent is to make them unnatural. In passing, it is worth while to notice that the same rule applies in the portraiture of grown-ups too; that is why the casual snapshot, especially where several people are included, so often produces a caricature of at least one of them.

Fig. 3, taken a moment later, is much better; the face is relaxed into a natural expression, and the lighting is even without being flat. And as the main lights are on the child and the boat she is drawing, she stands out vividly against the darker background.

Then she raises her face for another look at the boat—note how the light from the farther window outlines her face against the shadows behind her. That is worth another film—Fig. 4. But as her drawing approaches completion her concentration flags, she becomes aware of the camera, and the self-consciousness that immediately appears puts an end to any chance of further pictures until she becomes absorbed in her next pastime.

Fig. 4. With the face outlined in light against the darkness behind, a splendid likeness results.

Enlarging, Printing and Retouching

By T. ALBERT LOOK.

ENLARGING HINTS

THE use of an undiffused light, by which is meant a light passing through the condensers only, will give a more contrasty print than if the light is diffused by the use of a ground-glass screen or by using an opal bulb.

A ground-glass screen near the light-source will soften the picture, and if a second screen of very fine grain is placed between the condenser and the negative a further softening will be obtained.

In particular, the use of diffused light is valuable as a means of reducing the ill-effects of such defects as scratches on the film, which show up far less in the print than they do when a plain condenser is used without ground glass.

Softening Definition.

Several other methods can be used to soften the definition or the contrast of an enlargement. For instance, if a piece of plate glass approximately six inches square is held between the lens and the easel, and gently wobbled while taking care to see that the centre of the glass is kept as still as possible and in line with the centre of the picture, there will be an appreciable diffusion in the result. This plan has been found useful when it has been desired to hide retouching.

Even steam rising from a dish of hot water placed in front of the easel will soften slightly both definition and contrast. So will a generous puff of tobacco smoke.

A popular dodge is to place a square of bolting silk, stretched and fastened to a frame, in front of the bromide paper during the exposure. The distance between the silk and the paper will govern the amount of diffusion.

Still another dodge is to place one or two layers of chiffon over the enlarger lens, but as this will soften contrast as well as definition the paper chosen should be more vigorous than the negative would require if printed normally.

Local Shading.

A simple method of obtaining local control is to fix a ball of cotton-wool at the end of a hat-pin or, for preference, a glass rod, and introduce the shadow of this on the bromide where it is desired to retard printing. Swing the hat-pin or glass rod round, pivoting it on the cotton-wool, so that while the shadow of the latter is stationary that of its support is not, otherwise the hat-pin or rod will show.

Rectifying a Tilt.

Most photographers have at some time or another tilted the camera when photographing high buildings, with the result that the lines in the subject converge towards the top of the negative.

If not too severe this can, with care, be corrected when enlarging, by the

simple expedient of tilting the easel. Proceed as follows. Focus up roughly for size and then tilt the easel back until the lines in the picture become parallel. Stop down the lens aperture to get the top and bottom of the subject sharp, and give a longer exposure.

Vignetting.

To get a picture that fades out into blank paper towards the edges take a sheet of card about the same size as the bromide paper and place it on the easel so that the part of the image to be printed is in the centre. Mark this out with a pencil and cut a hole slightly smaller than is marked.

When printing, hold the card between the lens and the easel, and keep it on the move in a circular direction in order to soften the edges.

Another method is to place a celluloid vignette mask the same size as the negative in the slide and enlarge in the usual way. These masks have the advantage that they can also be used with contact prints, but the amount of negative to be printed is fixed by the size of the vignette and cannot be controlled as in the former method.

CONTACT PRINTS

Holding back a part of a contact print is more difficult, but the following plan has been found quite successful. Upon the glass side of the negative where the holding back is required squeeze a little red or crimson water-colour and dab with the finger until it is spread out evenly. Use the colour very sparingly. If a film negative is used dab the colour on the glass of the printing frame so that it comes against the right part of the negative. Whilst printing, keep the frame on the move to avoid any sharp lines. Note that the thickness of the glass is relied upon to provide the necessary diffusion of the edges.

Softer Definition.

Contact prints can be softened in definition by the insertion of one or two sheets of clear celluloid between the negative and the paper. The amount of softening depends not only on the thickness of the celluloid, but also on the extent to which the printing frame is wobbled during the exposure. Exposed to a small or distant source of light the separation between film and paper would not affect definition at all if the frame were kept stationary.

Masking.

To get a white border to the print the use of a mask is generally recommended. But, as anyone who has tried it will know, it is not at all easy to put film, mask and paper all in their correct relative positions, and is well-nigh impossible to keep them there while closing the frame. The best plan of all

is to mask the negative itself by black paper stuck on, because then the mask can be positioned to suit the boundaries desired for the picture, and it makes no extra work or trouble in printing. A "routine" mask, the function of which is just to tidy up the print without making any pretence at trimming, can be made by sticking black paper to the glass of the printing frame. The fact that the thickness of the film intervenes between mask and paper will only cause a noticeably unsharp edge if the frame is moved quite a lot with respect to the light during the exposure.

SPOTTING and TOUCHING-UP

Opaque spots on the negative result in white spots on the print. These can be removed by touching-up with a black pigment for untuned prints or with a pigment of suitable colour if the prints have been toned.

The use of ordinary blacklead pencils is not recommended as they leave shiny marks, neither are they black enough to tone with a fully-developed bromide. It is possible to obtain special black "negro" pencils for this work.

Spotting with Water-Colour.

The disadvantage with pencil spotting is that it is liable to smudge by rubbing, and for this reason a slightly more difficult method of touching-up with the use of water-colour is recommended. This is done with indian ink, lamp black, or artist's black water-colour paint, applied with a fine and nearly dry brush. Glossy surfaces should be avoided, but if it is necessary to work upon these, mix the water colour with a solution of gum instead of plain water.

Toned prints can be spotted with the black pigment warmed up in colour by the introduction of a suitable amount of another paint, such as vandyke, madder-brown, or burnt sienna.

It is sometimes found desirable to darken a print locally, and for this purpose black chalk (supplied in bottles by artists' stores) will be found suitable. Rub it in, very little at a time, with the finger-tip, or roll a square of paper into a hard little "pencil" about one-eighth of an inch in diameter for smaller work.

To lighten any part of a print, either an ordinary ink-eraser or pumice can be employed. To use pumice, place about a level teaspoonful of the powder in the centre of a small square of fine muslin and tie the four corners of the cloth together, forming a bag. With this dab the print where the lightening is desired, thus depositing fine grains of powder, and then rub with the finger or thumb. The work is slow, but good results can be obtained with patience. Afterwards give the print a rub all over to even up the surface.

EVENING SUNLIGHT. *Cast shadows break up an uninteresting foreground, and in this case even make the theme of the picture.*

SUNSHINE seems almost superfluous for photography in these days of super-speed panchromatic materials and incredibly large aperture lenses. With such materials and apparatus, even a rainy day presents no difficulties.

My lenses are comparatively cheap affairs, and it gives me a certain amount of satisfaction to be able to produce negatives which are bright and sparkling, whilst the pictures they produce are looked upon with respect by my fellow members of the local camera club, who nearly all possess lenses that resemble enlarger condensers.

To have a camera fitted with a lens of modest aperture is not necessarily a handicap; rather the reverse, for it makes one look for pictures in subjects that are brightly illuminated by sunshine. And sunshine, although capable of producing horribly hard lightings when high overhead in summer, does help the photographer to obtain pictorial subjects from material which without this powerful illuminant would not be worth a second glance.

In certain circumstances sunshine can make even so ordinary an object

Photographing in Sunshine

By CLARENCE PONTING.

The high sun of midsummer does not produce nearly such pictorial effects as the more slanting rays of autumn sunlight. This article draws attention to some important points in the rendering of sunshine.

as a whitewashed wall into an intriguing subject if a shadow pattern is cast upon it by a nearby tree. The cast shadows on a white road are also invaluable for breaking up an uninteresting foreground, and now that autumn is approaching, and the sun will be lower in consequence, this fact should not be ignored.

Sunshine in itself could very well form the theme for a whole year's exposures. The combinations obtained, both for exteriors and interiors, are so attractive that pictures are bound to result if a suitable composition is selected, and if care is taken—very important this—to see that the sunlight forms a pleasing pattern rather than a general scattering of intense high-lights. But do not enter into the photography of sunlight in too casual a spirit, for if it is to be rendered effectively infinite care in selection will be required, and one's capabilities as a technician will be tried to the limit.

Photographing a subject illuminated by sunshine would appear at first glance to be a simple matter of setting off the shutter. The novices make millions of such exposures yearly, and not one is a success from the pictorial standpoint. The sunlight is depicted by white paper, whereas in reality it should be full of tone. Examine an object when it is strongly lit by sunshine, and you will see detail everywhere.

Unfortunately, the plate does not see eye to eye with the photographer. It will insist upon piling up density on that part of the negative, unless the matter of exposure is given considerable attention. The old hand knows that

A SUNLIT CORNER. *Ortho plate, $\times 2$ filter. 6 p.m., July.*

sunlight contains a large proportion of the ultra-violet rays, and that if detail is to be retained in the sunlit portions of his negative those actinic rays must be reduced by the use of a suitable filter on his lens. By so doing he will—if the negative is given sufficient exposure—enable the light in the shadows to record of a printing strength without the sunlit portions piling on undue density.

And, having grasped this fact, attention will have to be paid to the

development of the negative. Those who use tanks generally obtain good representation of sunshine simply because their developer is fairly dilute. Dilute developer and development sufficiently short to give a negative thin enough to enable the sunlit portions to print through are necessary for success. Friends who have seen my negatives make the remark, "Your negatives are almost ghosts." That is how they should appear when correctly developed, for the necessary contrast can be obtained by printing on a "medium" or "hard" bromide paper when the negative contains a long scale of gradation.

There would appear to be some advantage in the use of panchromatic material and suitable filters when picturing subjects containing extreme contrasts. All my subjects are taken on orthochromatic materials, and I find no difficulty in retaining a long scale of gradations in the negative

SUN-DAPPLED.

'Chrome film, no filter. 4.30 p.m., July.

if a $\times 2$ or $\times 4$ filter is used and a full exposure given to record shadow detail. A lens-hood is an essential for the majority of these subjects.

SCARBOROUGH SPA. Ortho plate, $\times 2$ filter to let white objects show against blue sky.

Working on Enlargements

By
"MODERNIST."

DURING the summer the amateur obtains many small negatives that can be enlarged during the autumn months and made into attractive pictures for home decoration. If these are worked up with oil and pigments a great deal of improvement from a pictorial point of view can be obtained.

First enlarge your negative to the size you want it on bromide paper, and develop for a black image. Do not trim the enlargement before working it up. This should be done when that is completed. Smooth or semi-rough surface paper should be used; a glossy paper is not suitable.

Materials and Equipment.

Obtain a large sheet of stiff cardboard several inches larger than your enlargement, and fix the print on this by the edges with strips of passe-partout mounting paper. This is just to keep it firmly in position during the process of working upon it.

You will now need the following materials:—

One small bottle of purified linseed oil.

One small bottle of japan gold size.

Four ounces of turpentine.

A clean, empty bottle holding about three ounces.

One tube artists' oil colour in ivory black.

One tube of the same in prussian blue.

These can all be obtained from an artists' materials shop for a few pence. In addition you will need a small, fine camel-hair brush, and a large quantity of clean cotton-wool.

Place about two ounces of turpentine in the empty bottle, add about quarter ounce of linseed oil, and about thirty minims of gold size. Shake this mixture up well, and allow it to stand for several hours before use.

Method of Working.

To use it you take a wad of cotton-wool about the size of an egg and moisten part of it with the mixture, then with a circular motion rub this well into the surface of your print. Go over the whole of it until the emulsion has been prepared

to receive the pigment. It is then ready for touching up and "controlling" the photograph.

Suppose you have a perfectly white sky on your print, which you wish to darken down to introduce or emphasise the suggestion of a cloud-form in it. Take a small, clean piece of cotton-wool and compress it into a wad. Squeeze out a small quantity of the ivory black on to a plate or piece of glass, and dip the wool into this so that a very small quantity of pigment adheres to it. Then gently rub this on a piece of waste paper so that most of the pigment is rubbed off before applying it to the print. The smallest possible quantity should be used, and the sky portion should be gradually built up to the darker shade. If too much is deposited the excess can always be rubbed off with a clean piece of wool.

Shadows can be darkened to any depth on the print in this manner, and half-tones can be introduced in white portions of the picture. When very delicate detail has to be strengthened it can be done by means of the small brush. White spots can be filled in also in the same way. When practice has been obtained and skill developed, it is possible to exercise a great deal of control on the bromide print.

Matching Surface and Colour.

The pigment sinks into the prepared surface of the print and does not show on the surface, as often happens with other methods of print control. Ivory black does not produce a perfectly dead black on a print. Used alone it has a tendency to show a greyish or brownish tint and this will show up on a pure black-and-white enlargement. To get the required tint it is advisable to mix a very small quantity of prussian blue with the ivory black, and when this is correctly done the pigment cannot be distinguished on the print.

After a few hours the whole surface of the print becomes "set," because the solution dries, and so makes the control-work part of the original image.

The print should be trimmed after this has happened, and can then be mounted in the usual manner either by dry mounting or by paste.

Amateur Cinematography

Angling with a Ciné Camera By D. CHARLES OTTLEY.

FROM now until late autumn the fine old sport of angling comes into its own, engaging the leisure hours of over two million "gentlemen of the silken cord." Roach and perch are at their prime, and the trout lies in wait for the seeker after a good "catch." Pike are exceptionally fierce and eels as long as the best "fishy" story ever told are waiting for conversion into an appetising dish.

An Angler's Day.

One wonders why no record exists in the form of a film depicting the angler's day. So much material exists essentially cinematic in application from which a scenario might evolve, bringing to the home screen yet another aspect of an essentially English sport.

A close-up of a spinning bait, except to the practised eye of an expert, might suggest a propeller from the *Queen Mary*, while shots depicting the many operations that go to the fashioning of a fly would make a worthy addition to any "hobbies" series that the amateur cameraman might be tempted to record. The best quality hooks, single, double or triple, are still bound to the gut by hand, waxen thread of a superfine quality being employed, plus a secret process jealously guarded through generations of workers of rendering the whole waterproof, tooth-proof and tension-proof. A first-class rod is a wonderful production and is still largely a matter of hand workmanship. The cane lengths undergo a complicated process of seasoning before bleaching and staining take place or before those cute, telescopic fittings of shining brass are run into position at the heads and tails of each section. Tests are carried out for weight, balance, poise, resiliency and flexibility before a final, over-all varnishing completes the job.

Sideline Subjects.

A documentary reel could be devoted to the rod alone, nor would the picturisation of so skilled a trade be without interest or value. Akin to the rod (and there are numerous types of rod) is the landing-net. Here again is found work for nimble fingers belonging to aged hands, for it is usually the elders of a "fishing tackle" family who, long after retirement, become the makers and menders of nets.

But the human side of the story is surely the angler himself. He is in a class apart, a law unto himself, a "fishy" customer who looks at life from the standpoint of a fish. He is secretive at all times, except when a day at the water's edge has come to an

end and we see him on one side of the bar counter with the innkeeper (also a fisherman and a teller of "fishy" tales) on the other. Then it is that his tongue relaxes and comparisons are drawn between the specimen on the wall, the specimen in the basket, and that purely fictitious deep-river monster that swims in an alcoholic environment within the imagination of both. On the job our friend is usually to be found "sitting pretty" upon a collapsible stool of the gallery queue variety or somewhere on the floor of a punt. With your camera ready observe him carefully, for he is worth it.

Filming the Angler.

He nods, yawns, scratches his head, yawns again and nods. Suddenly he assumes an attitude of alert attention. His fingers tighten on the rod, his arms give a slight upward jerk—a bite. If he be a devotee of the "fly" his role is definitely active, and in order to analyse the grace of some of his sweeps and swishes it is necessary to resort to slow-motion. A finer example of rhythmic animation does not exist than a sixty-four-frame-per-second exposure upon an expert fly-fisher. Similarly, few more

charming pictures can grace the home screen than shots of fat trout browsing just beneath the surface of a sun-drenched stretch of deep, still water. The sharp whisk of a tail, the momentary glimpse of a silvery belly, and a mass of glittering ripples that pass as a kaleidoscopic mosaic across the screen. There is magic in such shots, a charm that more nearly approaches the beautiful than anything "directed" or rehearsed.

Bait, Live and Dead.

We now pass to a very important section in any angling film—*bait*. If there exists any one topic upon which two fishermen can never agree, that topic is bait. That which suits the one will seldom find favour with the other, and should a third person be so ill-advised as to offer an opinion he will most certainly be made to realise the folly of his indiscretion. There is live bait and dead bait, bait that the angler digs for, bait that he waits for and bait that he manufactures himself, and all the above are separate and apart from any form of mechanical bait.

Of the bait that he prepares, flour mixed with water which produces "dough," and bread soaked in water and

Angling, though a peaceful sport on the whole, has its exciting moments. No fishing film would be complete without a shot showing the landing of a fish.

thoroughly kneaded are probably his most favoured products. These processes should be shot and used as a prologue to that portion of the reel depicting the actual art of fishing.

Dawn and sundown are favoured times for sport at its best and infinite scope exists at these periods for the introduction of pastoral shots of great beauty. Sequences should be carefully built up with plenty of intercutting. Close-ups and semi-close-ups should be shown of the angler and his gear, the viewpoint dividing itself between the two extremities of the rod, the hook end and the reel end. The float should be shown both before and during a "bite."

Any member of your audience with the faintest of faint memories of an hour's fishing will not fail to react with a real thrill when the bobbing quill shoots sharply beneath the water's surface.

Bear in mind the importance of atmosphere when compiling the takes. Comparison is an asset in this connection. Let the camera ponder a ragged urchin with short cane and bent pin before presenting the angler proper with tackle costing pounds. Show a penny net being manipulated by a little "Lizzie" in some picturesque backwater accompanied by another toddler with a familiar marmalade jar held ready for her "catch." Show a tiddler accustom-

ing itself to the interior of the jar and then cut to a good five-pound trout floundering in the landing-net.

If a portion of the shooting can be carried out during one of those autumnal showers that the angler appreciates so much, all the better. Photographically, a river like the Cherwell at Oxford, although beautiful at all times, is strangely enhanced when rain falls. It is scarcely necessary to urge the use of panchromatic stock for a subject of this kind. The many advantages of the modern emulsions are too well known, but it may be worth remarking that particularly in a film of angling can full justice be done to them.

City of L. and Cripple Gate P.S. St. James's Park. Mr. Holloway.
Exeter C.C. Half-Way House and Aylesbeare.
Iford P.S. Through London's Parks. Mr. Roughton.
Leicester and Leicestershire P.S. Outing to Kilby, Wistow Park and Great Glen.
Oldham P.S. L. & C.P.U. to Liverpool.
Oldham Equitable P.S. L. & C.P.U. Ramble at Liverpool.
Sheffield P.S. Holmesfield to Millthorpe. G. E. Walton.
Southampton C.C. Outing to Romsey Abbey. R. M. Fanstone.
Stockport P.S. Union—Liverpool.
Walthamstow and D.P.S. Virginia Water.

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Sunday, September 12th.

Aston P.S. Outing to Harvington.
Blackpool and Fylde P.S. Ingleton. F. A. Gardner.
Hanley P.S. Dovedale.
Ipswich and D.P.S. Whole-day Outing. Bury, Brandon and Breckland.
Woolwich P.S. Mystery Outing by Mr. Robinson.

Monday, September 13th.

Bournemouth C.C. Opening of Annual Exhibition.
Hampshire House P.S. Tring to Ivinghoe Beacon. G. Rigby.
Oldham Equitable P.S. Demonstration with Kentmere Paper.
Southampton C.C. Outing for Night Photography.
Walthamstow and D.P.S. Portraiture by Members.

Tuesday, September 14th.

Hackney P.S. "Bromesko."
Halifax P.S. Members' Prints through the Epidiascope.
Leicester and Leicestershire P.S. "Some Pictures and How They were Made."
Manchester A.P.S. "Famous Old English Inns." W. Browning Button.

Wednesday, September 15th.

North-West London C.C. Meeting at 110, Haverstock Hill, Hampstead.
Partick C.C. Print Criticism.
Solihiull P.S. "Bromide and Chloro-Bromide Printing."
S. Suburban and Catford P.S. Lecturettes. A. E. Marden.
Windlesham C.C. "Cinematics." J. King.

Exhibitions and Competitions

CURRENT AND
FUTURE.

The name and address in brackets indicates to whom to apply for further particulars.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, September 30. Rules in the issue of August 25.

The Amateur Photographer Novices' Competition.—Special prizes of supplies of films. Latest date for entries, September 30. Particulars in this issue.

Wallace Heaton Competition. Cash prizes every week.—Open to readers of *The Amateur Photographer*. Full particulars in advertisement page in this issue.

Nuro Competition.—Cash prizes every month. Special prizes for boys and girls under sixteen. Full particulars obtainable from any photographic dealer, or from Nuro Ltd., Biggleswade, Bedfordshire.

Isle of Man Sixth Annual Amateur Photographic Competition, £300 cash prizes.—Open until September 30. (P. A. Clague, Publicity Department, Isle of Man.)

"Daily Mirror" "Nushots" Weekly Photographic Competition. Cash prizes. (The Editor, "Daily Mirror," Fetter Lane, London, E.C.4.)

XVII Salon International de Photographie de Belgique.—Open, May–October. (M. Julien Lejeune, 70, Av. Van Becelaere, Boitsfort, Brussels.)

Eighth Chicago International Salon of Photography.—Open, July 15–September 19. (Alex. J. Krupy, Chicago Camera Club, 137, North Wabash Avenue, Chicago, Illinois, U.S.A.)

XXXII Salon International d'Art Photographique de Paris.—Open, October 2–17. (Le Secrétaire, Société Française de Photographie et de Cinématographie, 51, Rue de Clichy, Paris (9e).)

I International Exhibition of the Photo-Press and Literature (Jugoslavia).—Open, October. (Fotoklub Zagreb, Masarykova II, Zagreb, Jugoslavia.)

Royal Photographic Society of Great Britain, 82nd Annual Exhibition.—Open, September 11–October 9. (The Secretary, Royal Photographic Society, 35, Russell Square, W.C.1.)

46th Toronto Salon of Photography.—Open, August 27–September 11. (W. H. Hammond, 2, Gould Street, Toronto, Canada.)

Professional Photographers' Association Annual Exhibition, Princes Galleries, Piccadilly, W. "Camera

Portraits"—September 3 to September 15. "Photography in Commerce and Industry"—September 17 to September 29.

3e Internationale Focus Fotosalon, Amsterdam, Holland.—Open, September 11–26. (Focus, Ltd., Fotosalon, Bloemendaal, Holland.)

Second Western Ontario Salon of Photography.—Open, September 13–18. (A. E. Adams, 923, Maitland Street, London, Canada.)

London Salon of Photography.—Open, September 11–October 9. (The Honorary Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.)

Fifth Annual Salon, Rockville Centre, N.Y.—Open, September 11–18. (Dr. M. F. Lee, 74, N. Long Beach Road, Rockville Centre, N.Y.)

Anthracite Salon of Photography, Everhart Museum, Scranton, Penna, U.S.A.—Open, September 18–October 4. (Salon Director, Everhart Museum, Scranton, Penna, U.S.A.)

The Victorian International Salon.—Open, October 18–30. (C. Stuart Tompkins, The Junction, Camberwell, E.6, Victoria, Australia.)

International Photographic Exhibition, Budapest.—Entries, September 20; open, October. (Modern Magyar Fényképezők, VIII, Rákóczi-ut 19, Budapest, Hungary.)

Windlesham Camera Club.—Open, October 21–23. Last day for entries, October 2. (J. C. Hayward, Hallgrove, Bagshot, Surrey.)

Fourth Canadian International Salon of Photographic Art.—Entries, before September 10; open, October 23–November 15. (Exhibition Secretary, Canadian International Salon of Photographic Art, The National Gallery of Canada, Ottawa, Canada.)

Rotherham Photographic Society Forty-eighth Annual International Exhibition.—Entries, September 20; open, October 12–16 inclusive. (E. G. Alderman, Ruardean, Newton Street, Rotherham, Yorks.)

Sixth Irish Salon of Photography.—Entries, Sep-

tember 25; open, October 30–November 6. (The Hon. Secretary, 18, Morehampton Road, Dublin.)

"Irish Travel" Photographic Competition, 1937. Cash prizes.—Entries, September 30. (The General Manager (Photo Competition), Irish Tourist Association, 14, Upper O'Connell Street, Dublin, I.F.S.)

Cyclists' Touring Club (Metropolitan D.A.) Second Annual Photographic Competition.—Entries, September 30; open, October 28–30. (G. H. Craddock, 9, Lady Margaret Road, Kentish Town, N.W.5.)

Lincoln C.C. Eleventh Annual Open Exhibition.—Entries, October 1; open, October 29–November 26. (Miss E. Redfern, 8, Cecil Street, Lincoln.)

International Salon Oval Table Society, Inc.—Entries, October 23; open, November 16–30. (Oval Table Society, Inc., 10, W. 23rd Street, New York.)

1st Rhode Island National Salon of Photography.—Entries, November 1; open, November 15–30. (J. Clement Grimes, 103, Westminster Street, Providence, Rhode Island, U.S.A.)

International Photographic Exhibition in Debrecen (Hungary).—Entries, November 20; open, January. (Aszmann Ferenc, Ferenc Josef ut 27, Debrecen, Hungary.)

XIe International Fotosalon "Iris".—Open, January, 1938; last day for prints and entry forms, November 30, 1937. (F. Geeraerts, Brederodestr. 22, Antwerp, Belgium.)

Second Indian International Salon of Photographic Art.—Entries, January 15; open, March, 1938. (N. B. Cooper, Hon. Sec., Camera Pictorialists of Bombay, 53, Nicol Road, Ballard Estate, Bombay, India.)

Leicester and Leicestershire Photographic Society's International Exhibition of Pictorial Photography.—February 21–March 12, 1938. Last day for entries, January 29, 1938. (H. Foscutt, 19, Doncaster Road, Leicester.)

Edinburgh Photographic Society 76th Annual Open Exhibition.—Open, March 9–April 2. Entries, February 28. (John S. Rodger, 16, Royal Terrace, Edinburgh.)

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

PLATES.

SIR,—I was interested in the recent letter from Mr. C. Jones on the subject of plates, as my own experience has been that I usually get better results on the rigid form of material.

The difference, I find, is a slight general inferiority of sharpness in the case of film negatives taken under identical conditions as to stop, and with the same lens and camera, although this does not amount to patches of bad focus in different areas of the negative such as one would expect from the bulging he mentions. Nor is it due to any fault in the adapter, which is a solid affair of first-class make and has, moreover, been tested for register. The difference, which is very slight, seems to be due to the very nature of the film support itself.

Can it be that the difference in "quality" in the image is due to the emulsion on film being subjected to bending stresses which are absent in the case of plates?—Yours, etc.,

H. ZIMMERMAN.

BENDING METAL TUBES.

SIR,—I suggest that small-bore pipe made of copper is the most useful in making photographic gadgets, being least affected by water and chemicals.

Such tubing is generally hard and brittle as bought, but it is easily softened by making it red-hot, in a gas flame or otherwise, and then allowing it to cool. It can then be bent quite easily up to a point, the limit being due to the fact that bending has the effect of hardening the tube again. If, therefore, further bending is called for, it is necessary to re-heat and cool the tube as before. In an extreme case this "annealing" process may have to be gone through three or four times in order to get the tube to the shape required.—Yours, etc.,

F. W. DANIELS.

SIR,—In a recent issue of "The A.P." a method was described for bending metal tubes, using resin or lead to form a solid core during the process.

May I suggest that water, being incompressible, is just as satisfactory—at any rate I have found it so with quite thick-walled copper tubes up to 1 in. diameter. All that is needed is a pair of tapered wooden bungs to stop up the ends of the tube. They should be rammed well home, and can easily be removed with a vice or a pair of pliers after use, when the "core" just pours out.

Besides avoiding the cost and trouble involved with resin or lead, this method has none of the attendant dangers.—Yours, etc.,

N. G. NEWELL.

EXPOSING TEST STRIPS.

SIR,—The question as to what exposures to give test strips of bromide paper when enlarging is one which seems to perplex a number of your correspondents. The problem is not difficult, if it be tackled in a scientific manner.

It may be accepted that, within limits, the effect of light on a photographic emulsion is directly proportional to the time during which it acts. Hence, it is clear that a sequence of exposures must be arranged, in which each succeeding exposure is a given multiple of that which precedes it. In the progression commonly recommended this multiple is 2, and the progression reads 5, 10, 20, 40, 80, etc.

The above progression is suitable for "soft" bromide paper; but when using more contrasty material, such as Kodak "medium" bromide, the steps in this sequence are too wide, and intermediate exposures must be given. At first sight one might think that the progression 10, 15, 20, 30, 40, etc., would be suitable; but this is not so, for the reason that while 15 is 1.5 times 10, 20 is much less than 1.5 times 15.

To find the correct multiple and still retain, as is convenient, the figures 10, 20, 40, etc., we must dig a little more deeply into the mathematics of the problem. We must take the logarithm of 2, our previous multiple. This we divide by 2, and find the figure of which the result is the logarithm. This figure we shall find is 1.4142, and is the multiple we require. Using this figure as multiple, but dropping two of its decimal

places, we obtain the progression 5, 7.05, 10, 14.1, 20, 28.2, 40, 56.4, 80. In this progression it will be found that each figure is approximately 1.41 times that which precedes it. But we cannot count decimals of a second, and they may be discarded without serious error. Our sequence of exposures then reads 5, 7, 10, 14, 20, 28, 40, 56, 80.

Even in the above progression the steps are too wide for "contrast" bromide. We must now discard the space between 5 and 10, since it cannot satisfactorily be subdivided any further, and must arrange that our exposures are longer than 10 seconds, or whatever units of time we employ. But the spaces 10 to 20, 20 to 40, etc., can be subdivided into either three or four parts, as we think most convenient. In the first case, we divide the logarithm of 2 by 3, and obtain the figure 1.2599 as the multiple required. In the second case we divide the logarithm of 2 by 4, and so obtain the multiple 1.1892. Progressions derived from these figures to the nearest whole numbers will read 10, 13, 16, 20, 26, 32, 40, etc., and 10, 12, 14, 17, 20, 24, 28, 34, 40, etc. These figures are, of course, far from being mathematically correct, but they are near enough for practical purposes. In my dabbings with photography I have found them extremely useful, and I feel sure that your correspondents will find the same.—Yours, etc.,

R. F. BRIDGES.
 (Punjab, India.)

SOUTH AFRICAN PRICES.

SIR,—In reading through the issue of "The A.P." dated June 16th, 1937, I came across the letter from D. J. Coleman of New Zealand concerning the price of photography in N.Z. I wonder what he would say if he knew the prices we have to pay here in South Africa. For a chrome film ($2\frac{1}{4} \times 3\frac{1}{4}$) we pay 1s. 9d., and a panchromatic the same size costs us 2s. 3d. So I do not think he is as badly off as we are here. But I quite agree that it is rather a tall order to have to pay such prices.—Yours, etc.,

J. B. SEARLE.
 (Pretoria.)

HELP WANTED.

SIR,—Either your correspondent Mr. Cosio has been guilty of an attempt to hoax the astute readers of "The A.P." or he has himself been the victim of some photographic jester.

A "Watamother glass," I submit, is a lens—a Summar lens (Some-ma—"What a mother.")

A Dripper is a camera—a Leica, sometimes erroneously pronounced "Leaker."

If Mr. Cosio is serious, I should think he will find no difficulty in discovering a dealer who will answer any enquiries about a Leica, with or without a "Watamother."—Yours, etc.,

R. C. CLEMENTS, Jun.

SIR,—My translation of the word "Dripper" is D. and P. The difficulty of making your correspondent understand may have called forth the remark "What an utter ass!"—Yours, etc.,

P.S.—I have omitted my name and address as I am not anxious to start a vendetta.

SENDING CAMERAS BY POST.

SIR,—I have read with interest in a recent "Topics of the Week," your comments *re* sending cameras by post, and append for your perusal a method I have used, as a photographic dealer, with every satisfaction.

The camera is first wrapped, either in its original carton or loose, with two layers of corrugated paper along its length and then with one layer across its width and the whole secured by gummed tape or string. This will protect the camera from the flat blows it is likely to receive, but as the greatest danger lies in the instrument being dropped upon one of its corners, I have devised the following treatment to prevent this type of damage. A strong showcard is now wrapped around the previously described parcel to form a rough carton with each end open, and projecting beyond the original parcel by an inch or two. The two spaces so formed are packed fairly tightly with newspaper and the whole wrapped in thick brown paper and addressed to its destination with, of course, a tie-on label to bear the necessary postage stamps and prevent the blows given in franking the stamps from damaging the camera.—Yours, etc.,

W. NORMAN EDWARDS.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS

An Exhibition of yachting and ship pictures by F. J. Mortimer is on view during the present month at the Wallace Heaton Gallery, 127, New Bond Street, W.1. Admission is free.

The Ikonta camera of picture size 4.5x6 cm. and fitted with f/3.5 Tessar lens in Compur-Rapid shutter, costs £12 5s. In a Zeiss Ikon advertisement in our issue of August 25th, the price was given, through a printer's error, as £10 10s., which is the price of the Baby Ikonta with that lens and shutter.

One of our readers has asked us to announce that a month ago he lost, in an L.N.E.R. train at King's Cross Station, a 6x6 Rolleiflex camera in an ever-ready case. The number was 474251, and it had an f/3.5 Tessar lens, No. 179473. Within the last few days two men endeavoured to sell the camera to a dealer in London. If any reader can assist in tracing the missing article will he please communicate with Mr. Albert C. Mooney, 157, Denton Road, Newcastle-on-Tyne, 5.

On Friday, August 27th, a reader picked up an exposed Selo film, size 3½x2½, at Watendlath, near Keswick. If this note should catch the loser's eye, he should write to Mr. Ralph E. Watt, Flat 2, 357, Clapham Road, S.W.9.

We would remind members of The Photographic Miniature Postal Portfolios that the Annual General Meeting will take place on Saturday, September 11th, at the A.B.C. Restaurant, 150, Southampton Row, W.C.1, at 3 p.m. An informal meeting will be held from 11 a.m. to 12 noon at the London Salon, 5a, Pall Mall East, S.W.1, and after the Annual Meeting tea will be served. The meeting will then retire to the Royal Photographic Society's Exhibition at 35, Russell Square, W.C.1, and in order to facilitate arrangements Mr. George A. Slight, the Hon. Secretary, will be pleased to hear from all members who hope to be present, and would also like to know the number of friends expected to tea. Members are recommended to wear Club Badges, which are obtainable from the Hon. General Secretary, price 1s., as either a buttonhole or a brooch.

A Camera Club has been formed in Hawick, Rox. An attractive syllabus is being arranged for the winter. Will any photographers in the district who have not already been in touch with the Club, please write to the Hon. Secretary, Mr. David Hill, 23, Buccleuch Street, Hawick, who will be pleased to supply any information required.

The Harrow Camera Club informs us that the winter session will commence on

the 14th September, when an Exhibition of recent work is to be held. An interesting lecture, "5,000 Visits to the Zoo," by Mr. J. E. Saunders, F.Z.S., will be given. A very comprehensive syllabus has been drawn up for the winter months, and any amateur photographers in the Harrow district who are not members of a photographic club will be heartily welcomed at the Conservative Hall, Lowlands Road, where the Club meets every Tuesday at 8 p.m. The Hon. Secretary is Mr. C. W. Johnson, 4, Sheepcote Road, Harrow, who will send information to intending members.

The Gloucestershire Postal Photographic Society, which has a full membership of twenty-four active members, is now forming a second portfolio, and the Hon. Secretary, Mr. Chas. N. Fenton, 203, Copster Hill Road, Oldham, Lancs, will be pleased to hear from keen advanced workers with a view to membership. Interesting discussions on photographic topics take place in the notebook which accompanies the prints. The annual subscription is 2s. 6d.

Since our reply to G. M. (Yeovil) appeared in August 18th issue of "The A.P." we have heard from the secretary of the Stereoscopic Society, Mr. H. J. Mobbs, who informs us that his address

is now 41, The Gallop, Sutton, Surrey, not 89, Green Lane, Edgware, Middlesex, as published. This Society exists solely for stereoscopic photography and circulates monthly folios of work by its members in the British Isles, United States, Australia and New Zealand. Members criticise slides and vote for the three best in each folio; votes are cumulative on a ladder system and awards made six times a year. There is an entrance fee of 2s., and an annual subscription of 5s. All amateur photographers interested in this branch of photography should communicate with the Secretary at the address given above.

The Photographic Classes run last year by Mr. Arthur F. Stevens, 118, College Place, Camden Town, N.W.1, in conjunction with the Kentish Town Camera Club, proved very successful and are being continued this year. The Winter Session will reopen at the Kentish Town Men's Institute, Holmes Road, N.W.5. The officers of the Kentish Town Camera Club extend a cordial welcome to keen photographers. Dark-room, apparatus and materials are available for the use of members, who can enrol on Thursday, September 30th, and succeeding Thursdays, at 8 p.m.

The prize-winner in the first "Happy Holidays" competition, organised by Wallace Heaton, Ltd., is Mrs. Eva Myfanwy Dodd, 7, Rawlinson Road, Oxford, to whom the weekly award of 21s. has been made. Full particulars regarding these competitions for readers of "The A.P." appear every week in our advertisement pages.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. The series from No. 1 to 61 included all standard chemical and optical formulæ and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulæ issued by the leading manufacturers of plates, films and papers.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5x3, supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is 5½x3½x3 and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

91. Makers' Formulæ : Developers for Gevaert Papers—(1)

G. 251. General-Purpose M.Q.

Metol 13½ grs. (1.5 grm.)
Sodium sulphite (anhydrous) 220 grs. (25 grm.)
Hydroquinone 54 grs. (6 grm.)
Sodium carbonate (anhydrous) 358 grs. (41 grm.)
Potassium bromide 9 grs. (1 grm.)
Water up to 20 oz. (1,000 c.c.)

If crystallised sulphite is used, take 440 grs. (50 grm.). If crystallised carbonate is used, take 880 grs. (100 grm.).

Times of development at 65 degrees Fahr. :—

Ridax and Minuto 60 secs.
Prestona, Vittel D, and Artos 60–90 secs.
Gevaert, Orthobrom, and other bromide papers 90–150 secs.
Vertona* 120 secs.
Lantern Slides 90–150 secs.

*For Vertona, use double the amount of potassium bromide shown.

G. 253. Soft-Working M.Q.

Metol 27 grs. (3 grm.)
Sodium sulphite (anhydrous) 180 grs. (20 grm.)
Hydroquinone 9 grs. (1 grm.)
Sodium carbonate (anhydrous) 165 grs. (18.5 grm.)
Potassium bromide 9 grs. (1 grm.)
Water to 20 oz. (1,000 c.c.)

If crystallised sulphite is used, take double quantity shown. If crystallised carbonate is used, take 440 grs. (50 grm.).

This solution may, if desired, be diluted with its own bulk of water, when the time of development will be extended.

Times of development with the undiluted solution at 65 degrees Fahr. :—

Ridax 60 secs.
Prestona, Vittel D, and Artos 60–90 secs.
Gevaert, Orthobrom and other bromide papers 60–150 secs.
Lantern Slides 60–150 secs.

If warm-tone prints are desired, add 10 per cent potassium bromide solution until the desired tone is obtained.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Temporary Residence.

As I am only staying in England for a year shall I, as an Indian student, have to pay duty on a camera brought from Germany? And if so, could I get a refund when I return to India?

M. M. U. (Edinburgh.)

A resident in England would have to pay a duty of 50 per cent ad valorem on any photographic apparatus imported by him into this country. Since you are staying for a year in this country it is not improbable that this regulation will also apply to you, but we strongly recommend you to address your query to the Secretary, H.M. Customs and Excise, Custom House, Lower Thames Street, London, E.C.3, who will be able to give you much more authoritative information than we can.

Speed Numbers.

I have a Zeiss extinction exposure meter and also an exposure meter of tabular type. The instructions with the former say that an increase of 3/10ths DIN doubles the film speed, while the readings of the latter show that an increase of 2/10ths doubles it. Which is correct?

H. W. A. (Derby.)

An increase of 3/10ths DIN in the speed number represents a doubling of the speed of the film. We are inclined to think that you have possibly confused the figures used for calculation in the other exposure meter with the DIN speed of the plate, as calculators of this sort generally indicate a doubling of the exposure for every addition of 2 in the calculating figures.

Travelling.

Could you tell me what Customs regulations are likely to be involved, here or abroad, in taking a camera to Belgium and Germany, and what would be necessary in respect of developed and undeveloped films.

C. M. (Mansfield.)

As a visitor to Belgium or Germany we do not think you are likely to encounter any difficulty in taking a camera or film into the country. In leaving Germany with undeveloped films

a query may be raised if you have been anywhere in the neighbourhood of military works, and it may be necessary to have the film developed before leaving the country in order that the authorities may assure themselves that you are not taking with you information of any military value.

You are not likely to meet with any difficulty at the English Customs if you have provided yourself with a receipt showing when and where your camera was purchased.

Exposure Meters.

I have been comparing my photo-electric meter with one belonging to a friend, and find that his meter indicates over 50 per cent more exposure than mine. As I thought a photo-electric meter was a piece of accurate apparatus, I should like to have your comments on this difference.

M. S. (Glasgow.)

A photo-electric meter, if properly scaled, makes a quite accurate measurement of the total amount of light falling on the cell, and in that sense certainly is a piece of accurate apparatus. The conversion of this measurement into a statement of exposure required, in which terms a meter is usually graduated, is largely a matter of individual taste. One photographer may like the negative resulting from an exposure of 1/25th of a second in conditions where another photographer would prefer to expose for only 1/100th of a second. When divergencies of this order exist it is asking rather much to expect two independent meter designers to have exactly the same idea of what constitutes a correctly-exposed negative; in consequence their meters indicate slightly different exposures. In any case, the difference of 50 per cent that you quote is utterly unimportant; so small a change in exposure would make no difference at all to the finished print. Even on the negative it would be barely perceptible.

Rectilinear for Enlarging.

I have a chance of buying an f.8 Beck Symmetrical lens in iris mount. Would this be suitable for enlarging? And about how much is it worth?

J. R. H. (Cheltenham Spa.)

The Beck Symmetrical lens is of rapid rectilinear type, and will not give the same crisp definition as would a modern anastigmat. We think you would probably find it satisfactory for enlarging from quarter-plates, but we should hesitate to recommend it for enlarging from negatives much smaller than this. We regret that we cannot attempt to value the lens, but you will get some idea of what it is worth if you look at the prices of similar lenses offered by the larger second-hand dealers.

Apem.

I have recently acquired a camera bearing the name or trade mark APEM. Can you please let me have the name and address of the makers?

E. M. S. (London.)

The makers of the "APEM" cameras are Messrs. Soho Ltd., Soho Square, W.1.

A Novice Enquires.

Could you please help me to understand my camera, a Butcher's Carbine, or tell me where I can get an instruction book for it. Would this tell me all about taking photographs, or only what the various knobs and things on the camera are for?

S. E. L. (Manchester.)

We would refer you to Messrs. Ensign of 88/89, High Holborn, W.C.1, for an instruction book for your Carbine camera. This will tell you about the camera only; as general textbooks on photography we would recommend the following to your attention:—

"Brighter Photography," published by Iliffe & Sons Ltd. Also the "N.P." handbooks, particularly numbers one and two. These latter are obtainable from The Fountain Press, 19, Cursitor Street, E.C.4.

Factorial Development.

For some time I have been using a proprietary developer, finding the total development time by multiplying the time taken for the image to make its first appearance by a factor of 12. Would this factor be the same for other developers, such as Kodak developing powders?

T. J. T. (Oylegate.)

Development factors vary enormously, that for hydroquinone being 5, while for metol it is 30. We think that Kodak developing powders have a factor of about 18. In any case, factors need personal modification according to the kind of negative required, and it is generally necessary to arrive at a suitable factor by actual experiment.

Red Rag.

Until recently I have done my developing in a dark cupboard, but now have moved to a larger room, over the window of which I put red rag. Since then my negatives have tended to be very dense. I enclose one successful negative and one developed in the larger room.

J. B. (Amesbury.)

The negative which you describe as successful is very badly fogged, and the other is even worse. You cannot safely rely on what you call "red rag" to exclude actinic light from entering the window, and we are quite certain that it is the light passed by this that has fogged your films. Your correct course is to block out the light altogether and use a proper dark-room lamp.

COLOUR the new thrill in snapshots..

Natural colour **without** filters or attachments, at exposures well within the scope of small-aperture lenses—that's the story of the new Dufaycolor film! For example—in the middle of a sunny day, 1/25 sec. at f/8 gives a perfect Dufaycolor picture of any ordinary subject. Dull days, though they need longer exposures, give equally good results.

You can buy Dufaycolor films in all standard sizes, including 35 mm. film for miniature cameras. Sub-standard cine film is also made.

Development and finishing services are provided by us, the film being sent to us by your local dealer. And finally—any number of black-and-white prints can be made in addition to the original colour transparency.

Start putting natural colour into **your** pictures! From now on, load with DUFAYCOLOR!

Full information and films at all photographic dealers.

16 mm. and 9.5 mm. Cine Film also available.

DUFAY-CHROMEX LTD 14-16 COCKSPUR ST S.W.1

Send for this book

The full story of Dufaycolor, with detailed exposure guides, and instructions for processing, etc., is contained in the book "The Dufaycolor Book" (post free, 8d.). For this, please write to Dufay-Chromex Ltd., 14/16, Cockspur Street, London, S.W.1.

TRY THE

PURMA SPECIAL

AND SEE WHAT A WONDERFUL LITTLE CAMERA IT IS—

The cleverness of the design of the PURMA SPECIAL lies in the absence of knobs to turn and gadgets to confuse—and in its ability to produce good photographs in all weathers. Tests have proved it. Nothing could be simpler to operate. There is no focussing—everything from 12 ft. to infinity is dead sharp—no lens aperture or speed dial to set—no calculations of any kind. The speeds are 1/25th (for poor light), 1/150th (medium exposure) and 1/450th (for fast subjects). The adjustment of speed is automatic—decided by one of three ways of holding the camera. From each roll of ordinary V.P. film costing 1/- you will get 16 sparklingly clear pictures. With the PURMA SPECIAL you can indulge in miniature photography in the most enjoyable form—and at the least expense, for the PURMA SPECIAL CAMERA costs only 50/-.

Purma portrait attachment, 3/6. Ever-ready leather carrying-case with shoulder strap, 10/6. Carrying sling, 2/6.

NOW READY.—A new book which will help you to get the best results with your camera!

Brighter Photography

by DAVID CHARLES, F.R.P.S.

This handy book reveals in a clear, attractive way the secrets of successful photography. Though primarily intended for the novice, it is invaluable to every keen camera user.

The carefully arranged chapters cover the whole field from the choosing of a camera to developing and printing the finished picture. Details of the various photographic materials on the market are given, and there are important sections dealing with Focussing, Aiming the Camera, Photographic Groups, Lighting and Exposing.

In addition there are over one hundred and sixty illustrations, each numbered and each conveying a really useful hint. By simple cross references these illustrations provide a series of clear, concise lessons in the art of making better pictures.

ILIFFE & SONS LTD., DORSET HOUSE, STAMFORD STREET, LONDON, S.E.1

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS:—

12 words or less 2/6
2d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 230, Deansgate, Manchester, 3; 26a, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer," when both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged; over £10 and under £50, 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to ILIFFE & SONS LTD., and crossed

& Co.

Notes being untraceable if lost in transit should not be sent as remittances.

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

The Complete 9.5 mm. Cinematographer

By HAROLD B. ABBOTT

Because of advances in film technique this book supersedes the author's former successful book "Motion Pictures." The beginner can take it up and find everything he needs to know in order to make successful pictures.

How to choose a 9.5-mm. ciné camera; how to expose correctly; what to take and how to take it; full instructions on developing and printing; methods of planning, of editing, titling and trick effects; the art of projection; methods of operation, screen and picture sizes; giving an efficient show; all these are explained in detail.

There are nearly 100 illustrations. The book, packed with useful information, is a comprehensive course of instruction in amateur cinematography.

EXPOSURE METER

The "Prinsen" is the simplest exposure meter controlled by a photo-electric cell. Only one adjustment, according to the speed of the plate or film to be used, is necessary, the "Prinsen" will then instantly indicate the correct exposure at any lens aperture.

BALDAX

Roll-film camera for 16 pictures 1½ x 2½ in. on standard 8-exposure 2½ x 3½ in. roll film.

Here is a pocketable camera. The precision mechanism and compact design combine to produce perfect pictures. Rapid in use; you just press a button and the camera front springs into position. All-metal body, leather covered, nickel fittings and direct-vision view-finder. Direct spring view-finder of two optical units enables quick finding of the picture. Pressure plate holds film in exact focal plane during the exposure. Struts of entirely new design assure a rigid grip upon the lens.

Fitted with
Vidnair 1/4.5 Anastigmat, Vario shutter..... 54 7 6

DOLLOND
 OWL No. 4

Miniaturists!

HERE'S YOUR ENLARGER FOR ONLY 5½d. A DAY!

ENSIGN AUTOMATIC MAGNAPRINT

For Miniature Negatives. Simple automatic focussing device.

WITH 60-mm. DALLMEYER F/4.5 ANASTIGMAT

The lamp body is constructed of light metal. It has a removable top fitted with a lamp-holder. Its tubular mounting is very rigid, free from vibration and provides ventilation to the condensers. The general finish is ripple enamel and nickel plate. The carrier is provided with masks for a variety of sizes. The baseboard is very substantial, supports the mechanism with great rigidity, and is provided with sizes chart and paper clamps. All models are wired complete with plug, flex and switches. **Cash £9:10:0**

15 EQUAL MONTHLY INSTALMENTS OF 13/4.

**FOCOMAT, PRAXIDOS, SIMMONS, EXAKT,
FAM & FILMAREX, ALL ON EASY TERMS**

STRIP PRINTS

FROM LEICA AND OTHER
36-EXP. 35-mm. NEGATIVES

Wallace Heaton were first as usual with this new method of dealing with miniature films. We make complete strip prints (36 exposures) for 3/6. These may be had on velvet or glossy paper as required. A photo-electric exposure installation ensures uniformity of results from even widely different negatives. This is the best possible method yet introduced for filing purposes. Strip prints can also be had on transparent film for projection: these cost 5/- per 36 exposures.

WHAT A CUSTOMER SAYS ABOUT OUR STRIP PRINTS

Kendal, Westmorland,
9th August, 1937.

"Many thanks for your prompt attention to my order. I must remark on the quality of the negatives and strip prints. They really are excellent.

I shall certainly not hesitate in referring my friends to you for developing and printing. Thanking you,
N. H. E."

YET ANOTHER SERVICE FOR THE MINIATURIST

Striving at all times to render the most useful and intelligent service for the development and after-treatment of miniature films, we have now standardised a new and harmless hardening process to which all films 35-mm. wide, developed by either our ordinary or "Microlux" (Regd.) process, are subjected.

No charge is made for this service, which ensures that your valuable negatives are immune from the thousands of small surface scratches which so easily ruin unprotected negatives. To scratch films which we have processed can now only be done by brutal mishandling.

WE STOCK EVERYTHING FOR SILENT & SOUND PROJECTION

BELL-HOWELL FILMO SOUND '138'

Single case, 16-mm. sound-on-film projector. 1,600-ft. capacity, light in weight. Provides theatre quality reproduction of both sound and picture. Will project your own silent films as well as sound library films. Ideal for home or club use.... **£138:0:0**

24 monthly payments of £6 3s. 8d.

ASK FOR FREE DEMONSTRATION

BOLEX G.916 PROJECTOR

Compass Roll Film Back.. **£5 0 0**

WE CAN SUPPLY 'AUTOMAX' (Regd.) PRINTS

From Leica, Contax, Retina, Robot, etc., enlarged to 3½ × 2½ or 4½ × 3½ for 2/6 a dozen, or from Rollei-flex, Rollei-cord, Ikoflex, and similar size negatives enlarged to 3½ × 4½ for 2/6 a dozen. Get these big-sized prints from your miniature negatives—They're ideal for your album collection.

WARNING!

"AUTOMAX" (REGD.) PRINTS.

It has been brought to the notice of Master Photo Finishers Ltd. (Wallace Heaton, Managing Director) that a number of firms have been supplying prints of their own, under the description of "Automax." Please note that these prints are the particular product of Master Photo Finishers Ltd., and that "Automax" is their registered trade mark. Anyone detected in supplying under the description "Automax" prints which are not made by this Company will be proceeded against.

"Automax" Prints can be ordered from Wallace Heaton Ltd., of 127, New Bond Street, London, W.1, and from their branches, also from the branches of City Sale & Exchange (1929) Ltd., and from other dealers who are authorised by Master Photo Finishers Ltd. to retail "Automax" prints. No print is a genuine "Automax" unless it bears the trade mark "Automax" printed on the back.

"Microlux" (Regd.) is also a registered trade mark, belonging to Master Photo Finishers.

SMOKERS

... DO YOU REALISE THAT

What you pay for 20 cigarettes a day

WILL BUY A

Leica**CAMERA—IF YOU BUY IT FROM US**

At the end of your day's smoking, what have you? Twenty—thirty—possibly fifty cigarette stubs. A little pleasure gone up in smoke. For the cost of twenty—**only twenty**—of those cigarettes, you could become the owner of a Leica II. And get pleasure which lasts a lifetime. 10d. a day on Wallace Heaton's easy payments is all it costs. Being designed to take a unique range of accessories and interchangeable lenses, Leica is the camera with the greatest versatility. Whatever subject a photographer may be interested in—Sports, Portraiture, Nature Studies, or just Holiday pictures—Leica meets the case. Next time you invite yourself to have a "fag" say: "No thanks, I'll have a Leica!"

★ **1/4½ A DAY BUYS A LEICA MODEL IIIA.**

As Model II, but with f/2 Summar lens, and speeded to 1/1,000th sec.
Cash price £43 0 0.

★ **10½d. A DAY BUYS A LEICA MODEL II.**

F/3.5 Elmar lens. Speeds: 1/20th to 1/500th sec. Chromium finish. Automatic focussing coupled to lens.
Cash price £27 17 0.

★ **7d. A DAY BUYS A STANDARD LEICA.**

F/3.5 Elmar lens. Speeds: 1/20th to 1/500th sec. Chromium finish. Up to 36 pictures one loading.
Cash price £18 5 0.

★ On our 24 monthly payment plan. Ask for particulars.

A LEICA PICTURE.

HAVE YOU ENTERED OUR NEW COMPETITION?**“TRAVEL SNAPS”**

ANY AMATEUR MAY ENTER, USING ANY CAMERA OR MATERIALS—SEE WHAT YOU CAN DO

You may send in travel pictures taken at home or abroad—pictures depicting the customs and scenery of the various localities. Scenes on the boat—embarkation pictures. Send them in at once—remember the prizes will be awarded for the best photography.

**FIRST PRIZE WEEKLY PRIZE
£25 CASH 21/- CASH**

OF ANY PHOTOGRAPH SUBMITTED FOR TWO GUINEAS. (If a guinea prize-winner for an extra guinea).

Copyright of the £25 prize-winning photograph and negative become the property of Wallace Heaton Ltd. without further payment.

Prizes are 21/- each week and 6 Certificates of Merit. £25 (twenty-five pounds) for the best photograph submitted during the competition (13 weeks).

If stamped addressed envelope is enclosed, every endeavour will be made to return photographs to competitors. No guarantee of safe return can be made and no entries will be returned unless above is complied with.

A selection of the best prints submitted in this competition will be exhibited in our galleries during November.

AMATEURS ONLY (full name, address, title of entry and coupon on back of each entry).

ANY MAKE OF CAMERA OR MATERIALS. DEVELOPED, PRINTED OR ENLARGED ANYWHERE.

ANY SIZE, MOUNTED OR UNMOUNTED (not less than 8x6 unmounted is recommended).

SPOTTING ONLY TO REMOVE DEFECTS (no faking or retouching).

WALLACE HEATON LTD. HAVE THE RIGHT TO PURCHASE THE NEGATIVE AND COPYRIGHT

Last week's prize winner ("Travel Snaps" Competition): W. F. HOLMAN, 12, Hardwick Road, Eastbourne.

Address your entries now to "Travel Snaps."

Where Extended Payment has been brought to the very highest Perfection

The simplest, friendliest plan. No irksome formalities. No delays. Exclusive advantages. Valuable Safeguards.

These Two Magnificent Opportunities

Zeiss Ikon Super Ikonta
(Model 530/15) Entirely Brand New
(Limited number only)

With famous Zeiss Ikon range-finder, Zeiss Triotar f/4.5 lens, Klio shutter, 1/5th to 1/100th sec., T., B. and delayed action, etc.
Attractive Picture Sizes. For 8 exposures $4\frac{1}{2} \times 2\frac{1}{2}$ in. on normal spool, with option of $16 \times 2\frac{1}{2}$ by removable mask. Full size is most pleasing shape and generous dimensions; smaller is amply big enough to give good pictures of itself, yet exceedingly economical.

ALL THE NEWEST AND BEST IN STOCK ON OUR VERY EASY TERMS

CINÉ-KODAK "8"
 9/- a MONTH
 for 24 months.

Halves running costs. Takes 25 ft. of 16-mm. film, half of which is exposed at a time. With f/3.5 lens.

Cash price **£10:0:0**

ZEISS CONTAX II

The famous precision minicamera. With focal-plane shutter speeded to 1/1,250th sec. Zeiss Tessar f/3.5 lens. 36 exposures at a loading.

Cash price **£40:10:0**
 36/4 a month for 24 months.

NEW Voigtlander OPTICAL-FINDER "BESSA"

The new optical finder springs into position, with its shield removed directly the camera is erected, making it easy to select the best angle of view. It has automatic trigger release and changes automatically from 8 to 16 pictures, or vice versa, on 3½ × 2½ roll film. With f/3.5 Voigtlander lens and Compur Rapid shutter, speeded to 1/400th sec. T. and B. Cash price... **£10:17:6**
 24 monthly payments of 9/8.

ENSIGN MINIATURE MAGNAPRINT

Its tubular mounting is very rigid, free from vibration. For focussing the body slides freely on the supporting column, and clamps in the required position. Fine focussing is then carried out by the helicoidal lens mount which is provided with a large knob which locks it firmly in position at the required point. Takes half-V.P. Leica and Contax negatives. With f/6.3 lens. **£5:5:0**
 Cash price...
 15 monthly payments of 7/5.

NEW ROLLEICORD
 Model 1a.

Bigger value than ever. Shows your picture full size and right way up on the ground-glass screen. Takes 12 pictures on 3½ × 2½ roll film for 1/. Body beautifully finished in art leather. With Compur shutter and Zeiss Triotar f/4.5 lens.

Cash price **£12:10:0**
 24 monthly payments of 11/3.

KODAK RETINA
 9/5 a MONTH
 for 24 months.

A really dependable Minicamera at a popular price. The Retina was used with great success on the last Mount Everest Expedition. It takes 36 exposures on 35-mm. cine film, and is fitted with high-grade f/3.5 lens. **£10:10:0**

LEICA IIIa

Chromium model, speeded to 1/1,000th sec., f/2 Summar lens in collapsible mount, 36 exposures at a loading. Cash price **£43:0:0**
 38/7 a month or 24 months.

Colour Film for Leica now in stock.

**A FEW
OF THE
REASONS
WHY YOU
SHOULD
GET A . .**

Rolleicord

MODEL II

1

Because it is equipped to give perfect all-the-year-round results. It has Compur shutter speeded to 1/300th sec., T. and B., and you have the choice of f/3.5 and f/4.5 Zeiss Triotar lenses.

2

Because it is the simplest camera in the world to use. It shows the picture full size and right way up on the ground-glass screen. No bother with fiddling little view-finders.

3

Because it takes 12 pictures on $3\frac{1}{2} \times 2\frac{1}{4}$ eight-exposure roll film—the popular standard-size film that can be obtained anywhere. The negatives come out perfectly with ordinary straightforward developing.

4

Because the Rolleicord can be adapted for plates or 35-mm. miniature film, and takes all Rolleiflex accessories except only the angle mirror. This great versatility offers enormous scope to the serious worker.

5

Because it is sold at a really popular price and represents the greatest camera-value on the market. With f/3.5 Zeiss Triotar lens £16 10 0
Or with f/4.5 Zeiss Triotar lens . . . £14 10 0

There is also the new model Ia Rolleicord—a camera of amazing value. With f/4.5 Zeiss Triotar lens . . . £12 10 0

PHOTOGRAPHIC PRODUCTS

GRANVILLE GULLIMAN & CO. LTD. LAMINGTON SPA.

PLEASE MENTION "THE AMATEUR PHOTOGRAPHER" WHEN CORRESPONDING WITH ADVERTISERS.

Do you know what this is?

The illustration shows the shutter release on the Super Ikonta for $2\frac{1}{4}'' \times 2\frac{1}{4}''$ pictures, which is conveniently situated on the camera between the film winder and the automatic exposure counter. The film winds on to a definite stop for each exposure so there is no need to watch the picture counter while winding on the film. The film wind is also coupled with the shutter release so it is impossible to take, unintentionally, two pictures on one section of film.

This model takes 11 pictures $2\frac{1}{4}'' \times 2\frac{1}{4}''$ on the usual $3\frac{1}{4}'' \times 2\frac{1}{4}''$ spool. The rotating wedge distance meter enables even the Zeiss Tessar f/2.8 to be used at full aperture with the complete assurance of needle-sharp focus, and the Compur Rapid shutter is speeded to 1/400th second.

There are other models of the Super Ikonta taking $3\frac{1}{4}'' \times 2\frac{1}{4}''$ and $2\frac{1}{4}'' \times 1\frac{3}{4}''$ pictures providing somewhat similar advantages.

All Super Ikonta models sold in Great Britain or Ireland at current listed prices carry the three-year guarantee. Ask your dealer for particulars.

SUPER IKONTA

Write for a copy of 'Miniature Camera Advantages with Large Size Pictures'. It tells you all about the Super Ikonta.

VOL. LXXXIV. No. 2549.

A SPECIAL Autumn Number of "The A.P." will be published next week, and will mark the beginning of the season when photographic activity is doubled. With modern photographic workers autumn represents the period when there are two worlds of photographic interest to investigate. Outdoor photography at the present time with panchromatic material is even more attractive than in the summer-time, while for those who have had their holidays, or have finished their outdoor camera work, the appeal of print-making becomes very insistent. In view of the enormous amount of miniature camera work that has been done during the present year, the autumn may be regarded as the "enlarging season." This aspect of indoor photography will be very fully dealt with next week. Our special issue, therefore, will indicate the phases of outdoor photography that are still available for picture-making, but the making of prints and enlargements will claim the greatest amount of attention. This is particularly appropriate in view of the exhibition season which has now started and a review of all popular enlargers will be one of the features of "The A.P." Autumn Number. It will be published on Wednesday next, and readers are advised to order their copies early.

The "Royal" and "Salon."

Elsewhere in this issue preliminary notices are given of the two big international exhibitions in London, that of the Royal Photographic Society at 35, Russell Square, and the London Salon of Photography at 5a, Pall Mall East. These two autumn shows can be regarded as containing the cream of the year's

TOPICS of the Week

A FIFTEENTH-CENTURY SHOP.

Old buildings have a fascination all their own, and make attractive subjects at any time when there is a gleam of sunshine.

(See article on page 297.)

work, the former being more general in its appeal, and containing representative examples of scientific work in addition to pictorial. The Salon, which concentrates on pictorial photography only, is an outstanding exhibition this year, and is more truly international than on any previous occasion. Twenty-seven countries are represented on the walls, which include, in addition to England, Scotland and Wales (which are represented by pictures by eighty-nine exhibitors), prints from the United States, Italy, Australia, Hungary, India, Japan, Canada, Sweden, Belgium, China, Austria, South Africa, New Zealand, Denmark, Germany, Holland, Switzerland, Ceylon, Colombo, Czechoslovakia, France, Honolulu, Java, Yugoslavia and Manchukuo. The total number selected is a trifle less than last year, although the number submitted was considerably greater, but in both shows it will be found that the outstanding feature is the magnificent quality of the prints. Everyone who is interested in photography should endeavour to visit these shows, which are open daily, until October 9th, Sundays excepted.

Inscriptions.

It is worth a little pains to see that exhibition pictures at any rate are properly labelled and properly catalogued. There is one portrait now showing at the Princes Galleries in the professionals' exhibition, the subject being a well-known member of the peerage, whose name, which is in large lettering on the print itself as well as in the catalogue, is misspelt. It makes no real difference, of course, to the excellence of the work, and yet it leaves us with the feeling that the "ha'porth of tar" has been grudged. When it is a

question of names and dignities, it is always well to fortify one's recollection, however sure, by a glance at the appropriate reference book. For names of places one should consult a gazetteer, and if a poetical phrase is chosen it is always well to verify the quotation at its source, not from another quotation, for it is astonishing how easily misquotations appear and are perpetuated by one copyist after another. A wrongly placed inverted comma, an unnecessary full stop, a misuse of capitals, can be quite distressing. We always remember the remark of a famous man to the reporters: "I don't mind what you make me say, but for heaven's sake spell my name right." Perhaps he would say to the professional photographer, "I don't mind how you make me look, but don't put me down a K.B.E. when I am a K.C.V.O."

The Democratic Touch.

It adds to the pleasure of the P.P.A. Exhibition to find it so

democratic. Apart from the section given up to the royal and coronation portraits, purpled off from the rest, so to speak, there were very few portraits to remind one of the presentation business which makes patches of the Royal Academy so dreary—those portraits with the inevitable "Esquire" after the name, showing someone looking his best for the benefit of posterity. It is a most fortunate circumstance that photography is not considered quite a suitable medium for the presentation portrait. It delivers us from very many embarrassments. As it was, professionals even with fashionable addresses, instead of showing the Hon. Mrs. Blank-Blank with her daughter Absentia, were content to show people like charwomen, negro minstrels, scavengers, flower girls, scullery maids, and so on—people who certainly had not paid for their sittings. The result gave an exhibition with quite a rollicking note, instead of the stiff and staid affair that it would

have been had all the portraits been commissioned ones.

Mrs. Marcus Aurelius.

A casual look round the sculpture gallery at the British Museum the other day suggested how modern some of the ancients are. There is a little head of the wife of Marcus Aurelius, which might be taken, from the style of hair dressing (hair parted in the middle and slightly waved), the type of feature, and even the top of the frock shown in the bust, for a rather charming woman of to-day. And there are other examples in the same gallery of people who lived, like the wife of Marcus, eighteen hundred years ago, and if they were photographed and put in a showcase they would be taken for contemporaries. Has the human face altered since the days of the old Greeks and Romans? A photographer who had the leisure and the skill might show side by side pictures of the ancients with their modern doubles.

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with under this heading week by week. Other replies appear as usual on the last page.

Bromoil Formulae.

Will you give me all the necessary formulae for bromoil work up to the point where pigmenting begins? I want to prepare them myself, and not to use commercial solutions.

C. J. C. (Lincoln.)

You do not say what experience, if any, you have of this process. Should you be experimenting for the first time we may warn you that you will certainly let yourself in for a vast amount of trouble and disappointment by setting about it blindly. It is far wiser in such a case to select a paper specially designed for bromoil work, adopt the makers' formulae, and work exactly to the instructions given.

We can, however, give you some typical formulae for the different stages of the process, but cannot undertake that they will work satisfactorily with any and all bromide papers. In fact, many of the finest bromide papers are definitely unsuitable and even impossible for bromoil treatment.

A clean and reliable developer for the original bromide print is the following, which should be made up just before use:—

Sodium sulphite	1 oz.
Fot. bromide (10 per cent)	20 min.
Amidol	50 grs.
Water to	20 oz.

The print must show full detail, but seldom deep black anywhere. The developing factor will be about 8 to 12.

A plain hypo bath, about 3 oz. to 20 oz. of water, is generally recommended. Wash very thoroughly.

A typical bleaching solution is:—

A. Copper chloride	160 grs.
Sodium chloride	2 oz. 290 grs.
Hydrochloric acid	3 min.
Water	10 oz.
B. Potassium bichromate	55 grs.
Water	10 oz.

These are stock solutions. The working bath is A, 1 part; B, 1 part; water, 2 parts, in which bleaching is complete in from 3 to 5 minutes. After thorough washing the print is fixed as before and again well washed.

A single-solution bleacher can be prepared from stock solutions, as follows, mixed in the proportions given:—

Copper sulphate (10 per cent)	170 min.
Potassium bromide (10 per cent)	130 min.
Chromic acid (1 per cent)	45 min.
Water to	3½ oz.

Wash, fix and wash as before.

Direct-vision Finder.

I want to construct a D.V. finder with two rectangular frames; how far should they be apart to show the correct amount of view?

B. P. (London.)

We can only tell you how to make the calculations, which may be worked out on paper, so that you will know the sizes of the rectangles and their separation beforehand. Much will depend on the construction of your camera.

Decide whether the front frame shall be the same size as the negative (which is preferable) or smaller. Then imagine a back frame of the same proportions, but some definite fraction of the size, such as half, a third, or a fourth. Thus if your front frame is 3 × 2 in., the back frame might be 1½ × 1 in. (half size).

Whatever this fraction may be, multiply its complement by the focal length of the lens, and this gives the separation of the frames. The complement of a fraction is the other fraction that must be added to it to make 1. Thus the complement of ½ is ½; of ⅓ it is ⅔; of ¼ it is ¾.

Example: Front frame 3 × 2; back frame ¾ × ½ (one-fourth); complement of ¼ is ¾; focal length of lens is 4½ in.; ¾ × 4½ = 3¾ in. = separation of frames.

ESSENTIALS for Picture Making by Photography

For the production of pictures through the camera, much more is required than just the necessary knowledge of how to take a photograph. Artistic and technical ability must work hand in hand if the finest results are to be achieved.

IT is now fully realised not only by photographers, but by non-photographers too, that photography is a medium of artistic interpretation. A visit to the exhibitions of the Royal Photographic Society and of the London Salon of Photography, which are reviewed on another page, can leave no doubt in the mind of any intelligent person that pictures of the highest artistic value can be produced with the aid of the camera.

What is Pictorial Photography?

Pictorial photography at its best has been described as a perfect combination of science and art. It is a fact that however well conceived the subject, or however masterly the composition, the result will fail to satisfy, and the picture fail, unless the technical work is flawless beyond question.

This does not necessarily mean that the pictorial photograph must reproduce all the detail and all the finest and most subtle gradations of tone in the original subject, though a majority of modern exhibition pictures do show perfect technique in this purely photographic sense. Sometimes the author's mastery over his medium is shown in quite another way, by the skilful suppression of unwanted and distracting detail, or by the deliberate massing of tones where their differentiation would not be helpful.

The art student pays considerable attention to the technique of his medium, and makes countless studies before attempting a serious production. The simplicity of modern photography gives the impression that the production of pictures is an easy matter, and it is often said that the pictorial photographer is tempted to learn his craft backwards, and to try his hand at making pictures before fully mastering the technique.

The Personal Factor.

The first essential in any work of art is that it should display something of the personality of the author. The subject may be commonplace, but the photographer's vision may see some unusual aspect of it, and display it in his work. The modern movement in photography attains this by presenting the commonplace from a

new angle, or under new conditions.

The original picture is really produced in the mind of the individual who sees in his subject an impression of strength, an effect of light and shade, or some striking or original pattern. The art of the photographer must therefore lie mainly in his power of selection and in his own personal way of presenting his subject.

It often happens that photographers are unconscious imitators of the work of others. Many good subjects are found, but are treated in a commonplace way. It is not given to many people to find original subjects, but there are still fresh methods of treating old ones. Even a hackneyed subject, if handled in a novel or striking way, can quite legitimately be used as the material for a highly individual and original picture.

Fundamental Rules.

Originality, of course, can in some ways be carried too far. There are certain artistic conventions that must always be adhered to in any successful picture. These conventions have been developed by degrees in the work of painters and draughtsmen, who found, by intuition and experiment, the various ways in which a satisfying picture could be built up, and in so doing evolved for us the rules of composition.

It is almost impossible to make some photographers see that the rules of composition are not an artificial growth, but just commonsense rules that assist in the presentation of the subject. The true artist obeys them almost instinctively, and it will be found that all successful pictures conform to them. They do no more than tell us how to arrange the pictorial material within the frame to the best advantage, putting the emphasis where it is most needed.

The photographer who feels the desire to produce photographs which are also pictures could not begin better than by paying a prolonged visit to each of the two exhibitions now open in London. Two visits are better than one, as the power of appreciation rapidly tires, and there is a great deal to see and enjoy, both at the Salon and the R.P.S.

Visualising the Result.

The ideal in the case of a pictorial photographer is for the final result to be clearly seen in the mind's eye. In a word the final print should be visualised. This means that each step in the production is pre-determined, from the selection of the negative material to the depth of tone of the finished print. And this brings us back again to the question of technique, for unless the necessary technical skill is there, the photographer cannot possibly produce a finished print that is true to his vision of his picture.

Apparatus and Material.

While it is as true to-day as always that the photographer's skill can operate successfully with any camera, any film, and any printing paper, the wise pictorialist will take advantage of any assistance he can get by choice of apparatus and material.

It may or may not be the case that the modern miniature is the ideal instrument for the pictorial photographer. The short-focus lens of the small camera will give great depth of focus at large apertures, a point that is often stressed in its favour. On the other hand this may be a limitation to pictorial work because it may mean that the depth of focus is so great that selective focussing, often of so much assistance in separating the planes of the subject, cannot be obtained in sufficient measure. The pictorialist must choose his camera according to the type of work he intends to do, and for this must have a knowledge of the capabilities and limitations of each.

An understanding of materials, too, is of great assistance. Success or failure does not depend on the use of fast panchromatic film, for example, because many outstanding pictures have been made in the past on slow ordinary plates, but in the hands of a photographer who fully understands the powers conferred by the newer materials any desired effect can be obtained so much more easily.

In photography, as in other branches of art, pictorial and technical ability are both essential to the production of the finest results.

Photographing

By MAUDE TEEVAN.

if one is encountered a photograph of it should certainly be added to the day's "bag."

The old saying "there is nothing new under the sun" often proves true, for many of the little cheap shops of to-day to be seen by the dozen on the outskirts of London and other big towns—just little open sheds with perhaps a shelter above, and trays or counter inside—are very like those shown in old paintings and prints of city traders several hundred years ago, when the merchant stood outside calling "What is it you lack? What is it you buy?"

The greengrocers' shops were perhaps the most picturesque, with their little carved rail round the counter, and baskets of reserve oranges and apples in boxes below.

In an old copy of the "Book of Days" that I have in my possession, there is a quaint drawing

A WEAVER'S HOUSE OF THE FIFTEENTH CENTURY.

SHOPS to-day, with all their lavish display of metal and glass, have quite lost the individuality and charm of many old-fashioned shop windows. Luckily, however, some of the latter are still to be seen in old towns; a very few in London, but more in our cathedral cities, perhaps because change and so-called "progress" moves slowly there. There are a few still left in villages, too, but as each year sees more of our old houses and shops swept away for ever, it is as well to photograph all those we come across as records.

Some of the old houses may not always have been used as shops two or three hundred years ago, but those that were each had a sign hanging out or painted above them. Some were hung in frames from a post stuck in the road, just as are many inn-signs to-day.

Sign painting flourished in the seventeenth century, when many young artists were glad to earn a little money before they became famous; Morland was amongst the later ones, though it is probable he did not paint half the sign-boards attributed to him.

Houses and shops were not numbered till about 1764, so sign-boards were the only means by which they could make themselves and their goods known to the public. Some of the paintings were very good and original, while others only aspired to the comical.

These signs are becoming rather rare nowadays;

THE CORNER SWEET SHOP.

OLD SHOPS

ANTIQUES. Observe how the figure enhances the appeal of the photograph as a whole.

of a shop, with its wares displayed in two enclosed glass cases, both *within* the otherwise open shop, not unlike the many enclosed showcase windows of to-day, except that in the engraving the framework is shown richly carved throughout, instead of the modern bare metal frame.

By 1750 some of London's shops were enclosed with glass; others, still unglazed, showed stockings, hats, etc., hanging from poles which could easily be hauled inside when it rained—for on wet days water poured down from the roof gutters on to the goods and on to the heads of the unfortunate wayfarers; umbrellas did not come into general use in this country till the latter half of the eighteenth century.

The photography of old shops, and

THE CROOKED DOOR. A Fifteenth-Century Shop.

where they still exist, their signs, is really a not-very-exacting branch of architectural work. Often the main difficulty is that of finding a viewpoint that does not include, as a glaring and most unwelcome contrast, the front of some modern shop utterly out of keeping with the main subject of the photograph. Sometimes, too, these old shops are in narrow streets, and the necessarily near viewpoint may call for a wide-angle lens.

Lighting may prove a difficulty, in a narrow street there may be only one hour during the day in which sunlight falls on the subject, and there can be no doubt that sunlight, especially the glancing sunlight that emphasises surface texture, carvings and the like, is very well worth waiting for.

Figures that are too modern and obviously out of place before an ancient building should be avoided as far as possible; have patience, for a more suitable figure is sure to come along in time.

OLD CURIOSITY SHOP, FIFTEENTH CENTURY.
The Shop of "Antiques" from another angle.

VERY wide and comprehensive in its scope is the 82nd exhibition of the Royal Photographic Society which is held at the Society's house at 35, Russell Square, London, W.C.1, and which was opened on the 11th of this month. The show will be open to the public from 10 a.m. to 9 p.m. daily until the 9th October next, and everyone who is interested in any of the many applications of photography of to-day will find much to attract their attention.

Sections are devoted to Pictorial Photography, rooms 1 and 2 being utilised; to Natural History, in room 3; to scientific and technical photography, for which room 4 is reserved; there is a small show of colour prints in room 1; a fine collection of lantern slides and transparencies in the studio; and the applications of photography in the service of record making, advertising, of the Press and theatre, in industry and commerce, and in connection with the cinema. Photomicrography; aerial, astronomical, meteorological and geological photography are also represented.

Pictorial Photography.

But it is the pictorial section that will present the greatest attraction to most of the visitors. Prints of a very high artistic quality have been submitted from all parts of the globe, from which about 200 have been hung. The selection, we gather, was very drastic, and, if the best of the more modern aspects of pictorial work do not find a place, quite an excellent show, of a catholic character, has accrued. Landscape holds a prominent place, but, perhaps, is not so strong as in previous years. One of the most noticeable examples in this class of work is "Beachy Head," by Dr. S. D. Jouhar (48), where the sunlight on the white cliff forms a highly attractive motive. The print is very rich in quality, is striking in its able management of contrasts of tone, and the effect is quite decisively brought forward. Of a quieter type is R. G. Spencer's "Evening in an Alpine Valley" (7), where the predominant impression is one of peace. The work is attractive on account of its very luminous quality and the admirable way in which the lines of the composition fall together. "Decorations," by J. McKissack (52), is also notable for its feeling of light, and the same might well be said of No. 17, "Evening, Ishgl," by W. Honess Lee. The composition, here, too, is very well designed and follows very much the same lines as No. 7, but in reverse, so that it would make a perfect foil and pair with the other extremely well.

"Richmond Castle," by Stephen Shore (35), is another landscape treated on traditional lines, very strong and emphatic, and its richness of tone is a thing to be particularly noted. In contrast, Fred Judge employs a delicate key for his impression of "Head of Ullswater" (61), which is extraordinarily atmospheric, and this, again, contrasts with the clear light and forceful tones of "Way Through," by H. A. Murch (62). The alternating light and shade on the mountain masses combine to form an

THE LONDON

Royal Photographic Society

intriguing theme and lovers of the countryside will find much to admire in this exhibit.

There are two excellent marine subjects, adjoining each other in Nos. 104 and 105, "Sunrise, Ostende," by L. W. Offord, and "Coal Barges," by L. N. Winder, both very luminous and bright, which are outstanding in their particular class, and another fine subject of somewhat similar genre is "Gondolier," by Erno Vadas (154).

Alexander Keighley maintains his reputation in "Village Assembly" (216), a composition that is characterised by its admirable grouping and fine expression of an effect of sunlight, and "Shaftesbury," by J. Ahern (215), shows an attractive impression of a street of old-fashioned cottages in evening sunshine with a wide-stretching landscape as a setting.

One of the finest of the portraits, which are not very strong numerically, is "Bound Girl," by G. E. Tomlinson, the figure being shown in dark tones against a lighter background, and notable work in this section is also shown by Dr. Tibor de Csörgeő, Albert Karplus, F. J. Jones, E. Heimann, S. Grimshaw, J. B. Eaton, Forman Hanna, Dr. Julian Smith, Walter Thomas, Gilbert Adams, John Keane, Walden Hammond, J. St. Aubyn, J. H. Leighton, G. L. A. Blair, A. Longman, J. Ainger Hall, Marcus Adams, Will Till and many others.

Colour and Scientific.

The stage to which colour photography has developed is illustrated by several examples, as far as prints are concerned, in room 1, but, on the whole, it scarcely seems as though the medium has been properly exploited from the aesthetic point of view. The actual rendering of colour may be faithful enough, as far as it goes, but choice of subject seems, in the main, to be regulated by the amount of vivid colour it contains rather than by a co-ordinated scheme of colour values in an ordered relationship with each other and in relation to their arrangement as a whole. Greys, which do so much to lend value to pure colour, are almost wholly neglected, and, in consequence, the impression that is conveyed is crude and unconvincing.

The colour transparencies, also, betray a like deficiency and the lantern slides in monochrome, in comparison, convey a very much better impression. Some of the slides which are shown in cases in the studio on the ground floor, are most attractive, those by James Shaw, J. Dudley Johnston and L. N. Winder, to mention only a few, being exceptionally noteworthy.

In the Scientific section, the value of the camera in the detection of forgery

is exemplified, and its employment in the identification of finger prints is illustrated. Examples of infra-red work are shown and several instances of radiography. Lovers of bird and animal life will find much of interest in the Natural History section, some of the work being characterised by a quality that stands comparison with the examples in the pictorial class, while the difficulty associated with securing subjects of this type can be imagined.

Only two medals have been awarded this year in the exhibition; one to Eric J. Hosking, for four bird pictures, which are up to his usual high technical standard, and the other to K. D. Sutcliffe, for a series of stereoscopic transparencies, also of natural history subjects ("Types of Fungi"). The Hood medal and the Rodman medals were not awarded, as the judges did not consider the entries up to a sufficiently high standard.

Apparatus and Materials.

Specimens of the newest thing in miniature cameras, their numerous accessories, and examples of the larger type of instrument are on show in great variety; there is a section devoted to the many developments in present-day materials, and in the hall and on the staircase a number of enlargements testify to the qualities of various makes of printing papers.

The Professional and Trade Section includes exhibits from most of the well-known firms and is distributed throughout the building. They will undoubtedly prove of the greatest interest to all photographic visitors.

A further notice of the R.P.S. exhibition will be given in a later issue.

Lectures at the Exhibition.

On Tuesday, September 14th, a lecture, "Sussex by the Sea," was given by Mr. G. E. W. Herbert, and during the period the exhibition remains open the following lectures will be given at 7 p.m.: Friday, September 17th—"With a Camera in the Antarctic," by A. Saunders; Tuesday, September 21st—Exhibition Lantern Slide Night, the slides selected for Exhibition will be projected on the screen; Friday, September 24th—"Enchanting Norway," by Frank R. Newens; Tuesday, September 28th—"X-Rays in Science, Art and Industry," by Dr. B. E. Luboshez; Friday, October 1st—"Shooting the Coronation with a Miniature Camera," by James Jarché; Tuesday, October 5th—"A Kodachrome Film of Tibet," by B. J. Gould; Friday, October 8th—"Over the High Atlas to Marrakesh, Morocco," by James Shaw. Seats for these lectures may be reserved in advance at a charge of 6d. each, but seats so reserved must be occupied by 6.55 p.m.

EXHIBITIONS

The London Salon of Photography

THE opening of the twenty-eighth Annual Exhibition of the London Salon of Photography took place on Saturday last, the 11th September, at the Galleries of the Royal Society of Painters in Water Colours, 5a, Pall Mall East, London, S.W.1, and, more than ever before, its distinctive character in displaying the best of what is new, and, at the same time, showing a fine collection of work on sound and established lines, is decisively demonstrated.

That it is able to do so depends, of course, on the fact that it receives what is probably a larger entry than any other show; that it draws upon the best of some thirty countries, and that out of a total submission of close upon 5,000 prints, only just over 400 can be hung. Naturally enough, the selection committee had an onerous and exacting task, and many pictures had to be dismissed with regret, but the severe elimination that was imposed upon them by the limitations of space has resulted in a collection of an exceedingly high standard, so much so, indeed, that only works of an outstanding quality could be accepted.

The General Impression.

The same scrupulous care has been extended to the arrangement of the exhibits not only in relation to each other, but as elements in a scheme which shows them off individually to advantage. The show, therefore, appears to be bright and interesting at first sight, and this impression is heightened as the pictures are studied.

Apart from pictorial appeal, the technical quality of the prints will be seen to be remarkably fine. The rigorous selection does, to a not inconsiderable extent, account for this, for a print that was not sound in its workmanship would stand small chance of acceptance, but it also seems to be a fact that, all over the world, the standard of achievement in this direction continues to improve, and, with the wide dissemination of information through the medium of the photographic press, it may be expected to advance yet further as time goes on.

Many fine prints have obviously been made on Gevaluxe, but the chlorobromides run it very close for richness of quality and strength of tone, and, in not a few instances, bromide paper, with a glossy surface, was brought into service. Workers in Continental countries, particularly Austria, Hungary, Czechoslovakia and Yugoslavia, seem to prefer this kind of surface, and, in the strong light of the gallery, there is no doubt but that they stand up to its searching character in a way that is wholly admirable and peculiarly their own.

Pictorially, it can scarcely be said that any pronounced departure from the normal and established order of things

has made an appearance this year. Novelties there are in plenty, but it seems to be the case that the eccentricities of yesterday have been assimilated and superimposed upon the traditional pictorial outlook with the result that the latter has been regenerated and has taken a new lease of life. In consequence, there is less of the "stunt" picture than may have been the case in previous years, and a general modernisation of outlook has taken its place.

Members' Work.

None of the work of the members—with, perhaps, the exception of Dr. E. G. Boon and Pierre Dubreuil—could be regarded as belonging to the extreme modern school, and most of them continue on the same lines as they have in the past.

Dr. Boon's work, however, is characterised by a strong feeling for decorative design and it is also notable for its excellence of quality, while that of M. Dubreuil is amusing, and, to say the least, extremely intriguing. J. H. Anderson has forsaken photogravure this year, but is represented by some admirable examples in Gevaluxe, and his subjects can almost be regarded as classical in the perfection of their arrangement. Nor does Marcus Adams, in his studies of children, depart from the accepted idea of composition. If anything, he seems to have got a bit more strength into them than he usually does, but, as usual, they stand in a class of their own.

G. L. A. Blair has two of his ship studies, rather more sombre than customary for him, and Harold Cazneaux has some excellent prints of Australian subjects. The portraits of Hugh Cecil are forceful as usual, and Angus Basil's exhibits are in a brighter key than in the work he has shown in recent years.

Notable Landscapes.

G. L. Hawkins repeats his success of last year with several landscapes on a magnificent scale in which, in a good number of them, the skies are a prominent feature. The way in which they are treated is masterly, and, in spite of the fact that landscape seems to have taken a back seat in recent years, it will be found that his prints hold their own with the latest things of the modern school. Alexander Keighley's carbons are on a similar scale and are also imposing in their subjects and the way in which they are handled. His compositions, without being hackneyed at all, are based on conventional lines and show an unexcelled power of selection. The tiny gum prints by J. Harold Leighton are little gems, each of which will repay careful study. The same may be said of the two prints by C. H. L. Emanuel.

J. McKissack has had a good year and his prints are as attractive as any he has yet shown. Mostly of harbour scenes or subjects of the romantic type in foreign climes, his interpretations in carbro are splendidly managed and nearly all include a fine effect of sunshine as the artistic motive. Leonard Misonne's contributions are not so effective this year. He is apparently trying the old method of pigmenting a partly or fully redeveloped bromide print, and the results are muddy compared with his usual beautifully luminous bromoils.

F. J. Mortimer well maintains his high reputation as a master of the various phases of the sea and shipping, and exhibits several striking examples. He also shows an impressive rendering of New York from a new point of view.

C. J. Symes has a number of his fine quality bromoil transfers of large scale and well maintains the standard he has set for himself.

Portraits of the King.

Bertram Park's profile portrait of H.M. the King is a fine piece of work. This, we understand, is the photograph that has been selected as the basis for the new George VI coinage.

Other notable work is submitted by Dorothy Wilding, with two outstanding portraits of Their Majesties the King and Queen, and several other strong studies. Rosalind Maingot with some beautiful studies of the nude. John H. Ahearn, who continues in his search for unusual viewpoints. Gilbert Adams, who is following successfully in his father's footsteps in his examples of child photography, and Antony Basil, who gives every indication of going one better than his father. Walter Bird again demonstrates his mastery of technique in both black-and-white and in colour, and Madam Yvonne adds a touch of brilliancy to the gallery with her experiments in colour photography.

Other British workers whose work calls for attention are Harold Burdekin, Stuart Black, Edwin Broome, A. K. Dannatt, W. Flower, Paul Fripp, E. Heimann, Fred Judge, Dr. S. D. Jouhar, L. A. Leigh, Arnold Longman, R. G. Lewis, H. A. Murch, J. G. Phimister, John St. Aubyn, Merlyn Severn, Paul Shillabeer, R. N. Speaight, and Madame Yvonne.

Foreign Work.

The foreign work, and that from America, again stands out for the individual qualities displayed—both in selection of subjects and in the high quality of the prints themselves. This particularly applies to the exhibits from Hungary, Austria and Czechoslovakia. Belgium and Holland are well represented, and the overseas work is better than usual, although not quite so numerous.

Further reference to these important exhibits will be made in a second notice of the Salon in next week's "A.P."

In the meantime it should be noted that the Salon remains open until October 9th daily from 10 a.m. to 6 p.m., Sundays excepted. M. S.

Readers' Hints, Tips and Gadgets

A FRAME FOR LANTERN-SLIDE PRINTING.

THE illustration with this article shows a gadget I have made for printing lantern-slides by contact. It is, I think, one of the most useful pieces of apparatus I possess, and it cost only twopence, the price of two bull-dog clips.

Any amateur who makes his own lantern slides by contact knows the difficulty of arranging the lantern plate in the exact position required in the printing frame. If it is a glass plate the task is not so very difficult, but it is most awkward if one

is printing from a film. The film curls and slides about on its glass support, and the lantern plate, too, slides about when the back is being put into the frame. Altogether it is a matter of chance if one hits exactly the portion of the negative required.

With the arrangement illustrated it is extremely simple.

The main part of the frame is a piece of three-ply, six inches square. On the front of this is glued a piece of green baize, and when set a piece 3-5/16ths in. square is cut out of the centre of the frame (with green baize also) with a fret-saw. This is the only part of the job which needs care.

The only other requirements are two bull-dog clips, a piece of clear glass (when the slides are being made from films), and a brass spring from the back of an old printing frame.

The glass negative is put into the position required over the square hole (emulsion side towards the baize) and clipped top and bottom. The lantern plate is dropped into the hole from the back, emulsion side downwards, and the loose back is dropped in also, finally the brass spring on the back is swivelled round to keep the loose back in position, and the lantern plate in good contact with the negative.

When printing from a film a piece of clear glass is substituted for the plate, and the film is slid under the glass into the required position. When exposed, all one does is to swivel the back spring out of the way, turn the whole frame over and the back falls out on to the hand, with the lantern plate uppermost ready for developing.

The great advantage is that with one clip in position the film negative may be slid under the glass and carefully placed, when the other clip is put on and the film is firmly fastened. The whole thing may be held in the hand while printing or it may be stood on the table leaving the hands free to do any shading, if necessary.

G. R. HINKS.

AN EFFECTIVE WASHING BOWL.

IT has been stated many times that when prints are washed the hypo-laden water sinks to the bottom of the vessel, and that unless this is removed the washing will be ineffective. The mere placing of the bowl under a stream of siphon is necessary.

This can be made by purchasing an ordinary enamelled bowl from the sixpenny stores, drilling a hole in the side about 1 1/2 in. from the top, and inserting a piece of rubber tubing about 18 in. long, the cost of which is about sixpence. The diameter of the tube should be about 3/8 in. A weight should be attached to the tube to prevent it rising above the required level by its natural

springiness and tendency to straighten.

The bowl is placed under the water tap, and it will be found that it will fill

up until the water level is above the top of the tube, when the siphon comes into action and the bowl is emptied. The

siphon will not work again until the water rises to its former level above the tube. The water tap should be regulated so that the water is carried off by the siphon about three times as fast as it comes in. By this means the water is being constantly changed and the hypo-laden water carried off entirely without attention.

It is advisable to apply a little enamel where the hole is drilled as chipping during the drilling process is unavoidable. A bowl of 120 fluid ounces capacity will be filled and emptied sixteen times in an hour using a tube of 3/8 in. diameter if the rate of water flowing in is regulated so as to fill an ordinary tumbler in fourteen seconds.

E. H. SARGEANT.

MAKING FILTER AND LENS HOOD FIT.

THE lens of many modern cameras has so narrow a rim that it is very difficult to make a filter or a lens hood stay in position. It can be clipped on, but at the slightest touch, or even if the camera is jarred, it flies off.

Recently I had this annoying experience with a newly-purchased filter-mount, and after some thought hit on the idea of fixing a small rubber band over the lens-mount as shown in the illustration. This made a non-slip surface, and even with a reasonable amount of jolting the filter-holder will stay securely in place.

My next problem was a lens hood to go in front of the filter. For this I cut a square hood from a cocoa tin, the width of the hood being made the same width as the filter mount, with a flange on each side to enable the hood to slip into the mount together with the filter. The ends of the tin were turned over to fit into each other, then squeezed together to make them secure. All rough edges were made smooth to prevent the

filter getting marked. Finally, the entire surface of the hood was made dead black to guard against reflection.

Those who have been faced with the same problems as I

would do well to try out the above ideas. They are cheap, but effective.

E. G. S.

THIS IS THE FIRST ALL-MINIATURE CAMERA SALE

We all incline nowadays to regard sales with a certain degree of suspicion. There has certainly been a regrettable tendency for sales to become first a habit and then, in many cases, little more than a ramp—a method of disposing of specially purchased junk at what only appears to be advantageous prices. In certain trades this kind of sale is an endemic and permanent institution.

This, however, is our first and only camera sale. It is demonstrably genuine because all the cameras described below have been considerably reduced in price and are in fact being offered in each case at lower figures than we have ever asked before. Next week, if any remain unsold, prices will definitely be raised once more to the normal level as the sale is for one week only. The condition of these instruments is fully guaranteed, but in the special circumstances approval cannot be allowed, although we are always ready to exchange any camera found for some reason or other to be unsuitable for other goods of equal value. This is the opportunity of the year to acquire a de luxe miniature camera at a really low price.

"MINIATURE CAMERA SALE"

CONTAXES:

Contax, latest current model I, with slow-speeds and improved type range-finder, indistinguishable in any way from new, and fully guaranteed, with instructions in makers' carton, fitted f/2 Sonnar lens£27 10 0
Ditto, fitted f/2.8 Tessar lens£19 15 0

LEICAS:

Leica Model 250, excellent condition, fitted f/3.5 Elmar lens£29 15 0
The same camera, fitted f/2 Summar lens£37 10 0
Leica Model I, interchangeable, fitted f/1.5 Plasmal lens£14 0 0
9-cm. f/2.2 Thambar. As new£14 15 0
5-cm. f/2.5 Hektor (coupled). Excellent condition£5 17 6
7.5-cm. f/1.9 Hektor (latest rectilinear focussing pattern). Practically as new£18 15 0
5-cm. f/1.4 Zeiss Biotar, coupled for Leica. As new£22 0 0

"MINIATURE CAMERA SALE"

4-cm. f/1.5 Meyer Plasmal. Cost £26. As new£10 17 6
5-cm. f/1.5 Meyer Plasmal. Cost £31. As new£12 10 0
3-in. f/1.5 Meyer Plasmal. Cost £36. As new£15 0 0
(All the above Plasmal Lenses are, of course, specially adapted for use with the Leica camera, with which they give perfect results).
15-cm. f/2.3 Astro with reflex attachment for the Leica. Cost £95. As new£55 0 0

CONTAFLIX:

One only, Contaflex, fitted f/1.5 Sonnar, ever-ready case and filter. Absolutely as new. Cost £90£49 15 0
8.5-cm. f/4 Triotar (chromium) for above camera. As new£10 10 0
13.5-cm. Chromium Sonnar for the above camera£14 10 0
3.5-cm. f/2.8 Biogon with special finder for the above camera£16 10 0

SUPER IKONTAS:

Three only, Model 530/2, f/4.5 Tessar, normal Compur. Practically as new£10 17 6
Four only, 530/2, f/4.5 Tessar, Rapid Compur. Practically as new£11 17 6
One only, 530/2, f/4.5 Triotar, Klio shutter. As new£9 17 6

SUPER IKONTAS—contd.:

One only, 530/15 (16 exposures on the 4½×2½ film), f/4.5 Tessar, normal Compur. As new£12 10 0
One only, 530/15, as above, but with Rapid Compur£13 10 0
One only, 530/16, f/3.5 Tessar, Rapid Compur. As new£16 19 0
Two only, 530/16, f/2.8 Tessar, Rapid Compur. As new£19 15 0

OTHER MINIATURES WITH COUPLED RANGE-FINDERS:

Baldaxette I (16 on 3½×2½), fitted f/2.8 Xenar, Compur. This is a guaranteed new but discontinued model for clearance. It is fitted with a very special parallax compensating view-finder.£12 5 0
Kodak Regent, f/4.5 Tessar, Rapid Compur and case. Guaranteed unused, slightly shop-soiled only£14 0 0

STRIP PRINTS FROM YOUR LEICA FILMS FOR 2/6 EACH.

We make complete contact strip prints (36 exposures) from your Leica or Contax films using glossy or velvet bromide paper for only 2s. 6d. each—at this price definitely the most economical and effective method of arranging a filing system of your results. In spite of the lowness of the cost, these strips are made on the new "Homrich" printing machine, which incorporates a special electric exposure meter, thereby enabling correct exposures and a uniform result to be obtained from negatives of most varying densities. Remember our price, 2s. 6d. per strip.

ALSO REMEMBER we are the firm who process miniature films in CHAMPLIN 15. The price for this best of all treatment for your miniature films including "scratch-proofing" of the negatives is 3s. 9d. for Leica-size films and 3s. for all other sizes.

NOTE. CHAMPLIN 15—the authentic American formula—is now available from us in the form of a concentrated solution requiring only the addition of water for its use. Price per bottle to make 20 oz. of developer (sufficient for about seven films), 4s. 9d., postage 6d.

Weltur, f/2.9 Radionar, Compur. As new£11 17 6
Roland, latest chromium model, f/2.7 Plasmal, Rapid Compur. Cost £27. As new£16 15 0
Kodak Bantam Special, f/2 Ektar. As new£19 15 0
Ensign Multex, f/3.5 Ensar, case. As new£11 10 0
Ditto, fitted f/2.9 Ross Xpres.£13 15 0
Ditto, fitted f/2.8 Tessar£16 10 0

"MINIATURE CAMERA SALE"

Other Miniatures with Coupled Range-finders—contd.:

Peggy Model II, f/2.8 Tessar, fitted cutting knife and with filter and case (this is an opportunity for buying a camera of exceptional quality at a really low price). Cost £32. Sale price£15 0 0
(This instrument may also be had at the same price fitted with f/2.7 Plasmal.)
Super Nettel, chromium Model II, f/2.8 Tessar. As new£19 17 6
Super Nettel I, f/3.5 Triotar. As new£11 18 6

MINIATURE REFLEXES:

Mentorette 6×6, f/3.5 lens, focal-plane shutter. Cost £25. As new£14 10 0
Rolleiflex 4×4, latest model with f/2.8 Tessar, Rapid Compur. As new£17 17 0
Rolleiflex 6×6, latest model with f/3.5 Tessar and Rapid Compur. As new£17 17 0
Rolleicord I, f/3.8 Triotar. Practically as new£9 17 6
Rolleicord I, f/4.5 Triotar. Excellent condition£7 0 0
Latest Lever-wind Exakta Model B, f/1.9 Dallmeyer Super-Six, case. As new£24 15 0
Latest Lever-wind Exakta Model B, f/1.9 Primoplan, case. As new£25 10 0
Latest Exakta Lever-wind Model B, f/2.8 Tessar case. As new£20 0 0

"MINIATURE CAMERA SALE"

Latest Exakta Lever-wind Model B, f/3.5 Tessar. As new£17 10 0
12-cm. f/6.3 Tele-Tessar for Exakta. As new£9 15 0
Voigtlander Superb, f/3.5 Skopar, case. Excellent condition£10 15 0
Kine-Exakta, f/2.8 Tessar, case. As new£30 0 0
Ikoiflex II, f/3.5 Triotar, ever-ready case. As new£12 0 0

MISCELLANEOUS CAMERAS:

Miniflex, f/3.5 Astro lens, Compur. As new£5 5 0
Kolibri, f/3.5 Novar, Compur. Practically new condition£4 18 6
Baldax (16 on 3½×2½), f/3.5 Trioplan, Compur£4 18 6
Picochic, f/3.5 Tessar, Compur. As new£6 10 0
Picochic, f/2.9 Trioplan, Compur. Excellent condition£4 7 6
Plaubel Makinette, f/2.7 Anticomar, Compur, filter. Good condition£8 10 0
Certo Super Sport, Model C, f/2.8 Tessar, 3 slides. As new£9 17 6
Certo Super Sport, Model C, f/2.8 Xenar, 3 slides and focussing screen£8 17 6
Weeny-Ultrix, f/3.5 Ihagee, Compur. Excellent condition£4 4 0
Argus (taking 35-mm. film), f/4.5 lens, 4-speed shutter. As new£3 0 0
Beira I, f/3.5 Trioplan, Compur.£5 15 0
Ihagee Parvula, f/2 Xenon. As new£10 15 0
Weltur Gucki, f/2 Xenon, Compur. As new£8 15 0
Voigtlander Perkeo, f/3.5 Skopar, Compur. Good condition£5 0 0
Compass, latest improved model. As new£19 10 0

(Two minutes from Holborn Tube Station in the direction of Oxford Circus.)

Autumn calls for colour photography —

Dufaycolor is the most perfect system of additive colour photography yet devised. The colour rendering is not an approximation, it is a precision record. The following points will interest every amateur photographer.

1. You can take Dufaycolor snapshots with almost any camera.
2. Your snaps are returned to you as transparencies—you see the scene again exactly as you photographed it—in perfect, natural colour.
3. You can have as many black and white prints as you wish by having negatives made from your transparencies, and printing in the normal way.
4. You can have duplicate transparencies from your own originals.
5. You can make the most perfect lantern slides in colour.
6. You can photograph all the Autumnal colours as easily as you can the brilliant hues of summer skies, and sea, and flowers.
7. You will be told all about Dufaycolor—and shown specimens of both transparencies and black and white prints—by your own photographic dealer.

The Dufaycolor Book which, in addition to a complete description of the process, has special sections devoted to:—THE MINIATURE CAMERA USER; THE AMATEUR PHOTOGRAPHER; THE AMATEUR CINEMATOGRAPHER; PORTRAIT PHOTOGRAPHY; COMMERCIAL, WORKS and PRESS PHOTOGRAPHY; TECHNICAL, SCIENTIFIC & CLINICAL

PHOTOGRAPHY. Readers of *Amateur Photographer* are invited to apply for a copy of this book (post free 8d.) to Dufay-Chromex Ltd., 14-16 Cockspur Street, London, S.W.1. Dufaycolor film is made in all miniature camera sizes from "16 mm." upwards.

SUMMER HOLIDAYS lived over again on a MILL'S EPISCOPES

MAKE a cinema show of your holiday snaps by projecting them as brilliant pictures, size 36 in. x 27 in., by means of the Mill's Episcopes "Major," the wonderful machine which reproduces on a screen distortionless enlargements of any opaque objects such as photoprints, coloured pictures, cigarette cards, microscope slides, sketches, etc., without any special preparation.

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

Unposed Figure Studies

By H. D. MEADS.

THE dodges which the writer has practised in order to obtain surprise pictures of native scenes and incidents in Malaya may perhaps be found of value to others who enjoy the thrill of stalking human copy in all parts of the world, for it is certainly not only the Asiatic who is "camera conscious."

As regards equipment, I have found a miniature reflex taking pictures on $2\frac{1}{4} \times 2\frac{1}{4}$ roll films to be a very serviceable instrument. At the time of spotting a prospective picture the shutter and diaphragm should be set for the necessary exposure, so that all that remains to be done is to select the most favourable viewpoint and to adjust the focus.

Since it is impossible in most cases to prevent the subjects from realising that one is taking photographs it remains only to conceal from them the fact that they are the prospective "victims." The appearance of taking any interest in the

focussed on an object at an approximately equivalent distance in the opposite direction. After this the camera was pointed across the road outside the building, at right-angles to the group. When it was observed that the grouping of the principal figures was just what was wanted, the camera was swung round in the hand at right angles to the line of sight, and the shutter released.

Unless one has only a direct-vision view-finder it is advisable to turn the camera round but not the head and

A Roadside Barber.

out behind, unnoticed by the subject.

Naturally, the technique adopted for this type of work must depend to a great extent on the camera employed. If a direct-vision view-finder is used then the photographer must await a favourable moment and move with speed if he is to catch his subject unawares. With a small "brilliant" type view-finder, such as is usually fitted to most folding cameras, a little practice will enable the operator to compose the picture with the camera held pointing to the side.

The principal difficulty encountered in this type of snap photography of close objects is that of focussing. If a reflex camera is not used, distance must of course be estimated by eye.

In conclusion I heartily recommend that those who have not done so should give this type of snapshot photography a trial. Subjects are easy to find in town, country or at the seaside in all parts of the world.

A Chinese Scribe.

body. Even if the "sitter" is watching the photographer while the latter is apparently taking a photograph in a different direction, in the instant of aiming the camera at him—provided that the operator does not turn in his direction—the "sitter" will not immediately realise that he is being photographed.

The use of the camera turned at right angles to the line of sight should be practised until the photographer has accustomed himself to making exposures rapidly in this manner.

The snapshot which is entitled "A Study in Fatherhood" was spotted while walking past, when, after proceeding a few paces round a corner of the road to set the camera in readiness for the necessary exposure, I strolled back again and took up a position with my back to the figures. Focussing was carried out, and the exposure made, with the camera slung round the neck and held under the crook of the left arm with the lens pointing

A Study in Fatherhood.

actual subject should be avoided, but after a casual glance, which should be sufficient to enable one to decide on the most favourable viewpoint for the exposure, let it appear that one is really after quite a different picture.

In the case of "Sikhs, Kuala Lumpur Post Office," after making the necessary shutter and stop adjustments while still at a considerable distance from the group, I tucked the camera under my arm and took up a position near-by, and

Sikhs, Kuala Lumpur Post Office.

A Photographic

By H. A. P.

THE best man said he wanted some pictures of the wedding that would be different—something in the modern style, conveying the spirit of a happy day. Then my wife, who had been debating the problem of fish knives or boudoir clock, said: "Why not give an album of pictures as a wedding present?"

It was a novel thought. I had never heard of a wedding present of photographs, but there seemed no reason why, given reasonable luck, one should not produce a record that would give at least as much pleasure as a toast-rack. It would be something personal, declaring itself without any doubt to have been made by me specially for you.

Avoiding the Crowd.

I decided not to go to church, where there would be Press photographers and crowds. Instead I got to the reception a few minutes in advance of the bride and groom in time to spy out the land, make quite sure of the position of the sun, and decide on a suitable background for one or two groups. Fortunately there was a lawn with a clump of trees and shrubs allowing semi-back lighting.

THE WEDDING DRESS. An unposed snapshot.

The Leica was obviously an ideal camera for a job like this, and it was loaded with Isopan I.S.S. in readiness for any eventuality. The light was brilliant, and the exposure meter said one five-hundredth at $f/4.5$ was possible. I was glad of this shutter speed, because I anticipated rapid shooting, with the attendant risk of camera movement, and $f/4.5$ was welcome because it gave good depth of focus.

The aim was to snap the occupants of each car as they alighted, so obtaining a picture of every guest. Having decided where the cars would draw up,

BRIDE AND BRIDEGROOM.

and where I would stand, the distance was measured with the range-finder, and the camera left focussed at the reading given, which was 18 feet. The camera was refocussed for exceptional shots and whenever there was time, but it was always put back to 18 feet in readiness for action.

Fixed Focus Justified.

The first three cars behaved exactly as they were expected to, but after that cars began to arrive two or three at a time, some pulling up in front of me, and some behind, and others driving straight to their parking-places. None of the guests knew I would be there with a camera, and the decision to work with a fixed focus was fully justified. At the end of five or six minutes I had made nineteen exposures,

THE WEDDING MARCH.

Wedding Present

and in the result every one of them proved to be reasonably sharp. This would not have been the case with a bigger aperture, and if I had to do it all again on a dull day, I would use a slower shutter and not a larger stop.

Twenty Minutes Work.

For the posed groups I opened up to $f/3.2$, still leaving the shutter at one five-hundredth, for I wanted groups with some suggestion of movement. The arrangement of the groups naturally took a few minutes, but the time taken to expose the whole spool was less than twenty minutes, and there was not a single unsuccessful picture.

Although a quick-firing camera of the Leica type is most convenient for a job of this kind, it would be possible

A GUEST WITH A CINE CAMERA.

to make a similar record with a relatively inexpensive camera. It would not have been difficult to find a dark corner for film-changing. It would have been necessary to keep guests waiting a few seconds while winding-on, but nine out of ten of the shots could have been taken with an exposure of one-hundredth at $f/8$ on super-speed film. The only essential is a reliable direct-vision finder; second to that comes complete familiarity with your camera, so that you need think of nothing but the subject itself.

Modern Miniature Cameras

THE SUPER-BALDINA.

THIS most recent addition to the well-known range of "Balda" cameras belongs to the class of "true miniatures," making 36 exposures on the usual 64-in. length of standard 35-mm. cine film. The camera is built for the standard daylight-loading cassettes, and the negatives are 24×36 mm. in size.

The camera itself is quite small, measuring only $4\frac{1}{2} \times 3\frac{3}{4} \times 1\frac{1}{2}$ in. over all projections, and weighs some 17 oz. When closed, the lens and shutter are completely protected by the baseboard, allowing it to be carried in the pocket without fear of scratching the lens.

This baseboard drops, and the lens front flies forward into position, on releasing the catch that holds the camera closed. The front, which is completely rigid in the extended position, carries a wide-aperture anastigmat mounted in a Compur shutter. In the model sent us for review the lens was a Meyer Trioplan of the usual 5-cm. focal length, working at a maximum aperture of $f/2.9$. It was mounted in a Compur Normal shutter speeded to 1/300th sec., without delayed action.

For focussing, lens and shutter move forward bodily, their movement being controlled by a radial lever the end of which works over a focussing scale surrounding the upper half of the shutter. Graduations on the scale extend to $3\frac{1}{2}$ ft. The focussing lever is attached to a cam-shaped rotating plate, which operates the range-finder through a swivelled plate and a lever. The range-finder itself is of the split-field type, in which the two images are adjacent but do not overlap. Correct focus is obtained when a line running across the division between the two halves of the field is continuous.

An unusual feature of the Super Baldina is that the view-finder, which is of the enclosed direct-vision optical type, has a tilting motion to correct for parallax. This tilting motion is coupled to the focussing, so that no attention is needed to ensure that the finder and the camera embrace the same portions of the subject focussed upon, no matter whether this is near or far.

The shutter release is placed in the conventional position on the shutter itself, but for those who prefer it provision is made for the use of the usual wire release.

Loading is performed in the manner usual in cameras of this type. The back hinges open to receive the loaded cassette, from which film enough is pulled out to reach across the back of the camera to the take-up spool. This is slotted to take the end of the film, and enough is wound on to allow the sprockets which control the advance of the film to engage with the perforations. The back is then closed, the fogged end of the film wound off, and the counter, which is concealed under a hinged cover, is set to zero.

When winding the film on after each exposure, the winding knob is automatically checked as soon as one frame has passed the sprockets. After exposure, a small release button has to be pressed to allow of winding to the next frame. There is no interlinking with the shutter mechanism. When all the film is exposed, the take-up spool is freed and the film rewound into the cassette for removal in daylight.

Except for the shutter release, which we should like to see removed to the body of the camera, as with so many modern instruments, we found that the controls fell naturally to the hand, making the camera very pleasant to use. A short test film gave us a series of sharp little negatives that would enlarge well, and the coupling of the range-finder to the focussing was found to be accurate.

With the lens and shutter described the Super-Baldina costs £13 5s., but it can be had if preferred with an $f/2.8$ Tessar at £18 10s., or with an $f/2$ Schneider Xenon in Compur Rapid shutter (up to 1/500th) at £19 19s. It is obtainable from any dealer, and further details may be had from the sole British agents, the Norse Trading Co. (London) Ltd., of 37, Rathbone Street, W.1.

Miniature Camera Gossip

By LANCELOT VINING.

H. K. (London) objects to my saying that in my opinion the 18-cm. $f/2.8$ Sonnar must be used on a tripod. I feel inclined to treat this objection as a mere quibble, as he goes on to say that a customer of his obtains excellent results using this lens with the Zeiss special breast support, which is "a device to be hung around the neck and strapped to the body." This sounds to me like a tripod of sorts, but even with this there is no guarantee that all photographers could use the lens without body movement, so I shall still stick to my statement that a tripod is required, always remembering that there are exceptions to every rule and one man's meat is another man's poison.

I thought I had made it quite clear in my notes of 1st September that my tests with these long-focus lenses were to find out the longest useful focal length for my work, allowing the camera to be used in the hand or with the short rest illustrated here on 25th August.

Red Filter.

Keep your eye on the sky these days, and every time you take your camera

VERSAILLES. Taken on I.S.S. film with a red filter.

out slip your red filter into your pocket. We are coming to a period of the year when it will prove its worth; only yesterday the sky was the perfect blue with just the right amount of white clouds, but I had not done what I am advising you to do, and my filter was locked away in the office.

My best sky this year was obtained the day I visited Versailles, when I

NOT UNDER-EXPOSED. A test film, exposed by meter at 32° Sch., developed in an experimental developer.

was using I.S.S. and a six times red filter. I developed the film in D76 and got a very fully exposed result with a certain amount of grain, so since that trip I only allow five times for this filter, and the results prove this to be correct.

Hopeful.

I have been experimenting with a new developer of my own blend. It is a solution easier to make up than Champ-lin's 15, and its action is far more consistent; so far it has proved grainless with I.S.S. and has not altered the film speed. Also it gives all the shadow detail, and copes with strong contrasts without the high-lights becoming clogged up; moreover, it does its work in 15 minutes. My first test is reproduced,

the subject being a white dog on green grass and a small cushion of very dark-brown material.

I called the film-speed 32° Sch. and gave 1/200th at $f/4$, and have obtained full detail in the dog's coat, the grass and the cushion. With the enlarger at full stretch there is no grain; but I feel that I must make many more experiments before I dare let the cat out of the bag.

TEN GUINEAS AND UNDER

A Section for the User of the
Inexpensive Miniature.

The Miniature on Board

By
G. C. DEUCHARS.

GOING ALOFT.

FOR the user of the small and unobtrusive miniature camera there are many opportunities for pictures on ship-board, no matter whether the occasion be a month's cruise, a day's pleasure-trip, or a Channel crossing. Those who like the more modern style of picture will find inspiration in the funnels, a winch or a ventilator seen against a background of sky, darkened to taste by the use of a deep yellow or even a red filter. More conventional photographers may perhaps prefer to take figure studies as their subject; for them both passengers and crew will provide ample material

OFF-SHORE LOADING.

in ever-changing groupings and poses.

It is in harbour, perhaps, that opportunities for the latter type of picture occur most freely. There are all the incidents of getting passengers and their luggage on board, and there may be some loading and unloading of cargo on the larger boats. But even at sea, where the ship is a self-contained world of its own, there is always plenty of material for picture-making.

The camera I use takes 16 negatives on V.P. film, and so makes as small a picture as any camera that takes standard roll film. With an f/3.5 lens and a Compur shutter, not many subjects, except perhaps high-speed work by artificial light, are outside its scope. It may be used without attracting attention, especially if one is apparently reading a newspaper or concealing the camera in some such easy manner.

A point I wish to stress is that, in my experience, it is most essential to good results to adhere more or less closely to the use of the same materials.

AT THE WINCH.

Of course, I do not mean that experimenting should not be done, but after one has discovered the means of obtaining the results aimed at, it is much better to stick to the same films, and more particularly to the same paper, in order to ensure being able to repeat the same type of result. There is a perplexing wealth of material nowadays, and of course it is almost inevitable that the dealer should say that one kind is as good as another, but nevertheless I imagine I am not alone in finding that each "make" has its own individuality, so to speak, and it is much against uniformity in results if one jumps about in one's choice of material.

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

ENLARGING AT HOME.

I have a Leica camera, and would like to know whether the enlarging of these films at home is a difficult process, and whether there is a big saving in cost by doing one's own. R. S. H. (Diss.)

Providing you have a suitable modern enlarger, preferably one made for use with the Leica camera, you will not find it difficult to make enlargements from Leica films. The cost of making enlargements yourself is very much less than having them made for you, bromide postcards being obtainable at prices from 3s. to 8s. per box of one hundred. Developer and fixer for one hundred would cost you perhaps 1s. or 1s. 6d., and after your first experiments you should be able to get at least ninety good prints from each hundred cards. We would recommend you to get a book on enlarging; the N.P. Handbooks Nos. 2 and 7, between them cover all you will need. They cost 1s. each, and are published by The Fountain Press, 19, Cursitor Street, E.C.4.

NEGATIVES TOO THIN.

Can you tell me whether the enclosed 6x6 cm. negatives were under-exposed or under-developed? I understand either might lead to negatives that are too thin. Could there be something wrong with the ultra-fast panchromatic film I used? Panatomic film, treated in exactly the same way, and with the same development, has always given me excellent negatives. M. V. S. (Glasgow.)

The small negatives you send are all under-developed, and you should have developed longer to get the necessary contrast. The exposure, though not generous, has been sufficient in every case, as the presence of shadow detail clearly shows. Some of the particulars you give suggest that you are not aware of the fact that different brands of film require different development times to secure the same degree of contrast, and that what is right for one film may be quite wrong for another. In particular, fast panchromatic film may easily require double the development time of a slow fine-grain film. But speed is not the only controlling factor; different makes of film of equal speed may require quite different development times. It is necessary to know the particular material you use.

WHAT IS THIS?

Readers who would like a copy of this puzzle and of the solution (see page 322) printed upon cards, may obtain them by applying to the Advertisement Manager, The Amateur Photographer, Dorset House, Stamford Street, London, S.E.1, and enclosing 1d. stamp. This offer is limited to existing stocks and no more than one set can be sent to any applicant.

how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CDIII.

Mr. HAROLD
ELWELL.

From information communicated to our Special Representative.

"ONE day, when I was quite a youngster, the parson asked me whether, if he hired a tintype camera, I would operate it at the church garden party. I agreed. I hugged the infernal machine to my bosom, and as my pitch was next to the coco-nut shy business was brisk, and the verger proved a born photographic tout. But success was short-lived, as in my eagerness to finish twelve pictures at once the developer-fixer spurted out of the tank; whereupon the verger dolefully returned the sixpences to irate clients.

"Serious photography commenced at the age of thirteen,

with a Box Brownie and a daylight enlarger. The latter piece of apparatus proved a boon to the manufacturers of bromide papers. However, during the first six months I won several prizes in the schools section of *The New Photographer*. With this sudden wealth I bought a Goerz Box Tengor, and followed my hero, the headmaster of the technical school I attended, on most of his photographic outings.

"Then, tired of making pipe-racks and penholders for the Band of Hope with my fretwork machine, I exchanged that pedalling terror for a quarter-plate folding film-pack camera.

This eventually led to a new $3\frac{1}{2} \times 2\frac{1}{2}$ Zeiss Ideal camera, with which I gained my first exhibition award, when I was seventeen, for a lantern slide at the Cheltenham Salon. In those days, except for free-lance Press work, all my negatives were printed as chloro-bromide lantern slides, as 15×12 bromide paper was much beyond my pocket.

"Mr. Willis Nevitt, of the Liverpool A.P.A., was my mentor, and I still hold firm to his belief that no photographic process can equal the quality of a projected image. In addition, diapositive work forces the tyro to be clean working, and he learns to judge the quality of a negative.

"When I was eighteen or so, circumstances forced me to adopt photography as a living; and having collected a variety of equipment I crashed into the soul-destroying sea of D. & P. around the English coast; but not long enough to learn to loathe photography. About eight years ago I used my first Leica camera, while working for the Covent Garden Opera Co., but I was unable to obtain results comparable with those of my other cameras.

"I realised later that the Leica camera was in advance of its time, and that new film emulsions and technique were an absolute necessity. It was not until a visit to a German cruising liner five years ago that I became a convert to the Leica. The photographer on board gazed at my two half-plate Graflexes in sorrow, and murmured, 'Mine friendt, you are carrying your coffin, no?' Thenceforward all my work has been produced solely with the Leica and its accessories; and under extremely difficult conditions in various parts of the world I have made pictures that were possible only with the Leica. I have used (and repaired) on board ship many miniature cameras, some of them more expensive than my own, but none had the same feel as the Leica.

"To aspiring miniaturists I would reiterate that a thorough grasp of a new technique is necessary. Use the slowest fine-grain pan. film compatible with lighting conditions, in conjunction with a good photo-electric meter for every exposure. Shun quack developers like the plague, and be scrupulously clean and careful with the processing of your films and the making of prints from them."

(A further example of Mr. Elwell's work is reproduced on one of the centre Art pages.)

REPUBLICAN STATUE, LISBON.

Harold Elwell.

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"SILKEN PATTERNS," by Dr. Don Arturo de Carvalho.

IN considering a subject of this kind, it is apparent, almost at a glance, that it differs very appreciably from what could be regarded as a normal rendering, and, upon reflection, it seems intended to convey a sort of impression of a natural effect by an extended exaggeration of the features it would customarily show.

A reasonable amount of emphasis or exaggeration is usually regarded as permissible in order to make the intention clear or to drive home a motive that may need a measure of accentuation. The liberty allowed under the term "Artistic Licence" is very wide indeed, and only restricted when it comes seriously into conflict with realism, or when it goes so far as to border on the ridiculous. It is often legitimately employed, for example, to heighten an effect of sunshine, to provide a strong light or dark as an accent to pull a composition together, or, by an extension of the normal degree of contrast to lend vigour and vivacity to a subject that would otherwise seem over-inclined to gloom.

It is brought into operation when a high key is adopted in order to convey a heightened impression of the delicacy of the subject, or when sombre tones are employed to stress a sense of storm. In these directions, I think it is justifiable—and most people, no doubt, will agree with me—and I also feel that, discriminately employed, it is a thing to be encouraged rather than condemned.

But, in this case, we look at the sky and find it so heavy in tone that it can only be said to represent its appearance some little time after the sun has set, or as it might seem after the moon has risen. In the foreground on the right-hand side, there is a splash of light which must be caused by the reflection of either the sun or the moon. We know, however, that it cannot be the latter, for, far as modern photographic materials and

equipment allow us to go, they do not yet permit an instantaneous exposure by moonlight, and the exposure must have been of short duration or otherwise the lines of the reflection would have been blurred if not entirely lost.

So we come to the conclusion that the picture is a result of a daylight exposure. With normal vision, however, it would be possible to see,

light, a similar dissociation with realism arises from the inference to be drawn from the reflections, to which reference has already been made. In neither event does the exaggeration seem to be justified, unless, perchance, some other motive exists which has not yet become manifest.

The argument might be advanced that the absence of modulation in the darks has simplified the tonal scheme, and a certain amount of confusion that might arise from detail there has been avoided. It might also be said that the greater depth of tone throughout tends to confer a richness and quality upon the lower tones that they would not otherwise show, or, from the purely pictorial aspect, that the depth of tone has imparted a softness and special appeal that would be absent in a natural and more truthful rendering.

My own feeling about the simplification—if that should have been the intention—is that it fails to achieve its object. Modulation—assuming, of course, that it is not allowed to become over-insistent—seems to me to be a necessary thing not only to convey a sense of form, but to permit a distinction to be made between the various elements of the subject material. Here there is no real distinction between the figure, the boat, and the distant hillside, and I feel that, instead of avoiding confusion, it has been made more confounded still. And, as far as over-insistence is concerned, it should surely be within the powers of the experienced worker to keep it within manageable limits.

Pictorially, too, I do not think there can be much beyond a sentimental, and consequently illusory, gain in æsthetic attraction, but this is a matter of opinion and everyone is entitled to his own. Experimentally, perhaps, the effort may have a value, but, on the whole, I do not recommend it for emulation. "MENTOR."

under such lighting conditions, quite a considerable amount of variation in tone in those parts of the subject that here are represented by an unrelieved black, and shown in silhouette.

It appears, therefore, that either the technique is deficient, which scarcely seems to be likely, or the depth of printing has been intentionally carried so far that these darks are darker than they could possibly appear to the eye, and, in their exaggeration, there is a conflict with realism. If the idea should be to simulate moon-

PRINTS FROM "THE A.P." BEGINNERS' COMPETITION.

1.—"Morning."
By John F. Carter.

2.—"Secrets."
By Edward W. Atkins.

3.—"Mixed Doubles."
By Miss D. Jean Charley.

4.—"The Comic."
By T. Murray.

5.—"Spring."
By J. Greenwell.

6.—"Riverside."
By R. E. Goodliffe.

PICTURES by Novices

*SOME CRITICAL COMMENTS on
the Beginners' prints reproduced on the opposite page.*

TALKING about candid portraiture, Nos. 1 and 2 of the prints reproduced on the opposite page—"Morning," by J. F. Carter, and "Secrets," by E. W. Atkins—are excellent examples, and, as far as the rendering of expression is concerned, I do not recollect any examples that have shown an equal degree of attraction for quite a considerable time.

Intimate Impressions.

It may be that everyone will not share my view, but I like the youngster in "Morning" and think that the intimacy of the expression has been wonderfully well caught. It certainly does get across with it and is quite a jolly and delightful little thing.

But the print itself is not as good as it might be. The face is rather too dark and the clothes too light. It is not very much out, but, were I handling it myself, I think I would try to turn it into a print of high key. The negative, I should imagine, would not display any excess of contrast, and, with no real darks, it should not be difficult to find a paper—of somewhat softer characteristics—that would give a lighter representation of the face while retaining more gradation in the lighter parts of the setting.

It would be necessary, however, to make a print of real quality or it would show little advantage over the present rendering. That involves a correct exposure and full development with gaslight and bromide papers, and, if chloro-bromide papers are employed, a strict adherence to the time required to obtain the desired colour of the image; or, put the other way round, there must be no curtailment of development, and the exposure must be adjusted to permit it to be continued for the proper time.

A Subject for Enlargement.

So that if, with this treatment, a print turns out too dark, it is necessary for the *exposure* to be reduced and *not* the time of development.

Reverting, however, to the child study under discussion, the image, in the contact print, seems perfectly sharp, and it would appear to be able to stand quite a considerable degree of enlargement. In my opinion, it

would be well worth the trouble, and, with the winter session coming on, it would be interesting to explore its possibilities in this direction.

On the other hand, "Secrets," while good enough as far as it goes, as a contact print, does not seem to show an equal decision of outline, and I do not think it could be enlarged to more than a very moderate extent without a fuzziness of image making its appearance.

This is unfortunate, but, unless it arises from the printing paper not being in proper contact with the negative, it cannot now be helped. It is more likely that either a slight error in judging the distance has occurred or the sitter has moved or altered her position after focussing had been set. As far as the rendering of the expression is concerned, it is as lively as the other, and no less candid or intimate.

Viewing Distance.

The figure, however, is over large for the picture space and I do not care for the way the top edge encroaches upon the head. Nothing would have been lost and a good deal would have been gained had a greater viewing distance been adopted and the spacing been more liberal.

Nothing can be done about it now that the print has been made, unless, perhaps, it does not include the whole of the negative, but these points should be kept in mind, and guarded against in the future. The two figures in No. 5, "Spring," by J. Greenwell, show an engaging natural quality in their expressions even if they do not convey the same intimate feeling of the two already discussed. Presumably, the sprig of foliage hanging from the top has been introduced with the idea of stressing the impression of spring, but, coming against the light as it does, I rather feel it does no more than complicate the setting, which otherwise would be commendably plain. A little more modelling in the features might have been obtained if the lighting, instead of being diffused in character, were more definitely directional as it would have been if the sun were shining.

No. 2, as will be seen at a glance, is much better in this respect, and the

effect of the strong note of sunshine is worthy of special attention.

Lighting and Modelling.

With No. 4, "The Comic," by T. Murray, the top edge again is too close to the uppermost of the figures, and it rather seems as though the subject had been taken the wrong way and that it would have been better as a vertical than a horizontal.

Apart from this, the print is useful, as it shows the effect of a strong directional lighting upon the features. It is rather frontal, but falling slightly from the left-hand side. Those of the heads that are looking in the same direction as the camera are illumined on both sides but to an unequal extent. They show a very desirable roundness of modelling in consequence. The heads that are turned to the right have less visible shadow, but, if they were not inclined, would still exhibit a reasonable measure of roundness until only their profiles were visible.

Then, as the light would be falling at right angles to their surface—or flat on—they would be all in light and little modelling would be disclosed. If the full face were turned towards the light, the left hand side of the face would, similarly, show little shape, but the right would seem sharply moulded. None of the faces show what would happen if they were upright and turned to the left, but so long as shadow were perceptible on the right-hand side, modelling, to a greater or less extent, would be present.

Sun-stricken Scowls.

It should be remembered, however, that when the face is turned towards the light there is a very great danger that it will cause the sitter to scowl.

A hint of this is to be seen in No. 3, "Mixed Doubles," by Miss D. J. Charley, which, in other respects, conveys a very jolly impression, and this example again shows the effect of a frontal lighting coming somewhat from the left. A little more over and the frown would not have made its appearance, and, in a case like this, I think I should try and counter the expression by moving to the right, so that, with this movement being followed, the glare would be removed from the sitter's eyes. "MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

THE IMPORTANCE OF PLANES.

ONE of Æsop's fables tells of a fox who lost his tail in a trap; whereupon he called together his brother foxes, and tried to persuade them that they would be happier and better without their tails, and that the only perfect fox was a tailless one. Similarly, our miniature friends, suffering the disability of no rising front to their camera, are trying to persuade us that such a movement is worse than useless; that vertical lines must and should

Fig. 1.

converge; and that all conventional perspective is, and always has been, completely false in this respect.

A correspondent argued, for example, that if a chimney-stack was the same width all the way up, a photograph or drawing should show the top narrower than the base, because it was farther away. When I challenged this I received a letter from a Cambridge M.A. saying that I was wrong, and that the top of the chimney *must* be rendered smaller than the bottom because it was farther from the lens. He ignored the fact that the lens itself does not agree with him, and persists in achieving the impossible by rendering both sides of the chimney vertical, and the width therefore the same all the way up.

Beginners must be puzzled by these arguments (which are hoary with age) even if they happen to remember what I said on the subject a few weeks ago. With the aid of the simple diagrams I have made I am going to try to state some of the facts in a comprehensible way, and hope I shall succeed in making the matter clearer.

I shall have to use the word *plane* repeatedly, and by it I mean, without any hair-splitting, a surface that is *flat*, such as a plain wall, a sheet of glass or paper, and so on. And when I say that a plane is *vertical* I mean, simply, that it is standing *upright*.

Fig. 1 is a diagrammatic rendering of a straight path, the same width throughout, with a brick wall on either side. The inner surfaces of the walls are vertical planes facing each other, and parallel with each other. The dotted lines marked W show the width of the path. The more distant one is shorter than the nearer one because it is on a more distant *plane*; and the vertical at the far end of a

wall is not so high as that at the near end, for the same reason.

Then the two walls and the path are shown in *plan* (not to scale), and the dotted line W again shows the width of the path. Now this width is decided by the *shortest* line that can be drawn from one side to the other; and this is also the distance between the two vertical planes of the walls. The longest straight lines we could draw on the path would be from a near corner to the opposite far corner, but these would not show the *width* of the path, nor the *distance* of one vertical plane from the other.

Please emphasise this in your mind: the vertical planes, *as a whole*, are one definite distance apart, and this distance is indicated by any line at right angles to their surfaces.

Now for Fig. 2. In elevation AB and CD are two vertical planes facing each other, as do the walls in Fig. 1. The distance between the two planes is indicated by the dotted line. Part of the plane CD is shown as a double line, P, and this represents a plate in a camera, while the short line, L, shows the lens in front of it.

Suppose part of the plane AB takes the form of a sheet of card on which is drawn a geometrical design which includes rectangles and circles. We know perfectly well, from constant experience, that we *can* get on the plate P an absolutely correct copy of the design. We may say that some parts of the design are farther from the lens than others, but, nevertheless, no rectangle will be shown in perspective, and no circle will be distorted.

Fig. 2.

It is important to note that although different parts of the design are at different distances from the lens they are all on the *same vertical plane*.

We can easily imagine conditions in which the depth of focus is so shallow that any object on a slightly nearer or farther plane than that focussed upon will not be sharp. In the case of the correspondent's chimney-stack, if the top is so much farther away it should then not only be smaller (as he contends) but also out of focus. But is it? It is not; and the reason is that it is on the *same vertical plane* as the base.

And now I will have a shot at the explanation with the aid of Fig. 3.

Here AB represents, in elevation, the famous chimney-

stack, which is an elongated rectangular prism. The double line, P, again represents a plate, and the dot, H, a pinhole. I have chosen a pinhole instead of a lens for simplicity, as each ray of light from the subject passes direct through the hole to the plate without refraction, and there is no need to bother about the position of the nodes in the lens.

Fig. 3.

A ray of light from the point C passes through the hole H to the point D on the plate; and the distance HD represents the focal length at which the pinhole is working to record the point C. A ray of light from the point A passes through H to E, and for this point HE is the focal length of the pinhole.

Now it is obvious that HE is greater than HD. That is, in a sense, the pinhole is working at *different focal lengths*

according to the position, on the plane, of points in the object being photographed. This holds good also for a lens, provided it is constructed, like an anastigmat, to give an image on a flat surface.

Perhaps I may defend myself in advance against at least some possible lines of attack. I was careful to say just now that we *can* (not *must*) get an undistorted rendering of a geometrical design (or anything else); but there are conditions and limits.

For example, the angle included by the unmoved eye is a very small one. If you look at the dial of your watch, and *fix* your eye on the XII, you cannot see as clearly either the XI or the I, still less the V or the VII. But it is an easy matter to photograph the dial so that all the figures are equally distinct. We use lenses with a much greater angle than that of the eye. If, however, we go beyond certain limits we can get a sort of distortion which it is difficult or impossible to correct when viewing the result.

To recapitulate briefly. We should regard what is in front of the camera not as a number of *points* at all sorts of angular distances from the lens, but as an infinite series of *vertical planes*. Within certain limits we can get sharp and undistorted results when the plane of the plate is parallel to these object planes; and this could not be the case if such contentions as that about the chimney-stack were sound. It is an age-long and wise convention that, as a general rule, the *picture plane* is assumed to be *vertical*.

W. L. F. W.

“THE A.P.”

Special Competition for Novices

THIS competition is specially for Novices, that is to say, those amateur photographers who have never won an award of any description in a photographic competition, and preferably those who are only just starting photography.

The prizes will be awarded for the best snapshots of subjects that the beginner usually attempts. These include snapshots of the family, groups or single figures taken at home or on holiday, either indoors or outdoors, and landscape and beach scenes, etc., with figures. The arrangement of the subject and the pose of the figure or groups is a matter left entirely to the discretion of the competitor.

The entries will be restricted to contact prints and enlargements of standard “Enprint” size, which do not exceed $4\frac{1}{4} \times 3\frac{1}{4}$ in., even if made from the whole negative. These may be mounted if preferred, and the smallness of any print will not affect its careful consideration in this competition. The rules are very simple, but should be read carefully.

THE PRIZES.

The prizes in this competition will consist of supplies of roll film or plates (for those winners who happen to use a plate camera), as follows:—

The First Prize will be TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.

The Second Prize will be TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.

The Third Prize will be ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.

Twelve Prizes of ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

RULES.

Each print must have affixed firmly to the back a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor. The latest date for receiving entries is September 30th.

The copyright of all prints entered remains the property of the authors of the photographs, but the right is reserved by “The A.P.” to reproduce the winning prints and any others that may be worthy of mention. The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed to: The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked “Novices’ Competition.”

MAKING BETTER SNAPSHOTS-15

By DAVID CHARLES.

This article is the fifteenth of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

Fig. 1. The right figure in the right spot can sometimes be posed; usually one just waits for a passer-by.

Fig. 2. In the right place, but scarcely the right figures.

Fig. 3. This man matches the street much better. And the horse and van help.

THE editor recently called attention to the fact that all too many views, whether of town or countryside, are made without a sign of human interest in them. As he remarked, for the artist in pencil or paint it is comparatively easy to put a figure, and the right kind of figure, at the exact spot where it will do most good. But in

immense. Nor am I speaking here of the ambitious kind of picture in which a (presumably paid) model is posed. I am speaking of snapshots such as one makes of places visited.

Take, for example, Fig. 1. This alleyway, near Blackfriars, gives the characteristic light-and-shade effect of many such thoroughfares in that district. The shine of the rain-water on the roadway, and the line of the bridge overhead, cutting off the sky, help to make the "pattern" a little more unusual. The car drawn up at the kerb provides the necessary spot of intense blackness without which the lighter distance would look just light, but would lack the brightness of sunshine after rain. But with all that, what would the picture be without the man?

Successful Placing.

I think it will be agreed that he is the right sort of man for the place, and that he is in the right spot. The

question is, how was he got there? Purposely or by chance? The answer to that is that he was put there purposely, and yet that an element of chance was present. Let me explain.

It is quite obvious, on looking at the composition, that a figure walking on the pavement would throw all the interest on that side; the left half of the picture would

be almost blank. The figure must therefore be in the roadway on the left. People come and people go, but within five minutes this man passed by in just the right place.

Another Example.

The scaffolding and its shadows on the road in Fig. 2 seemed to offer an interesting study of lines. Many people and some children came along the pavement, but the roadway was deplorably empty. A wait brought these two men along, but after all they are scarcely the right characters for this slum street. Let us see what will come next. Aha! here comes an old-iron merchant. Far behind him a carrier's horse and van. Perhaps the van will catch him up in time—hope so—it does! And that is Figure 3.

That is how these figures were "put" in, and what would the pictures be without them?

Fig. 4. The boat breaks up the expanse of water, but was caught just too late. Nearer the centre would have been better.

photography this is not only difficult to do, but to some extent reduces the chances of the result being successful.

Finding a Figure.

On the other hand, to introduce a figure at the right spot in the picture is very far from being so difficult as many people might imagine. When the figure is there, one is never in any doubt as to whether the effort was worth while; the difference between a view with and without a touch of human interest is

Fig. 5. The water is variegated enough; it is the sand that is empty. But the figures should have been nearer and bolder.

Trimming the Negative

By D. J. STEVENS.

LOOKING through one's own old photograph albums and those belonging to friends the fact usually stands out that sufficient trouble is not usually taken in trimming or masking the negative before it was printed. Generally, in fact, there is no attempt whatever at selection; the whole negative is printed baldly, with a neat white margin to make the print a tidy, well-finished job.

To set against these improvements, there are two disadvantages in trimming the prints as received from the chemist. First, the white margin goes, and second, the part that remains surprisingly often turns out to be a mere postage-stamp. Both these objections, however, are ruled out if the negative itself is trimmed before being printed, and if this is done in such a way as to take advantage of the popular "Enprint" service.

Trim to Standard Size.

Assuming that films of size $2\frac{1}{4} \times 3\frac{1}{4}$ are used, the scheme is to try to trim them to one of the several smaller standard sizes. If one of these is a close enough fit to the desired composition, the trimmed negative goes to be printed as a standard small film and an "Enprint" comes back which contains only the wanted part of the original, is of a respectable size, and has its white margin

Fig. 2. The figure is too central, and there is too much out-of-focus point in the foreground. Trimmed size, 6.5×4 cm.

Whether it is a dislike for sacrificing the white border, or a feeling that it would be wasteful to cut away any part of a print that cost $2\frac{1}{2}$ d., the fact remains that most of the prints made by commercial firms, if stuck into albums at all, go in exactly as received.

Routine Printing.

Usually the chemist is asked for "One print of each, please, if it comes out," and as it is not his job to decide what part of the subject the customer wants he prints the whole of each negative as a matter of routine.

The result of a roll of film so printed is usually something like the photographs accompanying this article. In every case their value as pictures, and therefore as records and souvenirs as well, would be considerably enhanced by judicious trimming. By this means, as the white lines ruled on the prints suggest, a sloping horizon can be made level, unwanted foreground can be cut out, misplaced figures brought nearer to or farther from the centre, edge fog and other such blemishes removed, and the whole arrangement tidied up and made more attractive.

Fig. 3. This figure is too much to the side in the untrimmed print. Trimmed size, 6.5×4 cm.

all complete. You have all the advantages of a trimmed print without its disadvantages, and the cost is barely more than that of an ordinary contact print with all its faults of sloping horizon, edge fog, unwanted foreground, and too-hasty composition.

To aid in trim-

Fig. 1. Trimming brings the figure forward, levels the horizon, and removes a black mark. Trimmed size, 4.5×6 cm., and masked.

ming the negative, it is a good idea to obtain a $3\frac{1}{2} \times 2\frac{1}{2}$ ground-glass and rule on it squares and rectangles corresponding to all the standard sizes from $3\frac{1}{4} \times 2\frac{1}{4}$ downwards. These are 6.5×4 cm., 6×4.5 cm., 6×6 cm., 4×4 cm., 3×4 cm., and 24×36 mm. By holding the negative up to the light in contact with this ruled glass it becomes very easy to see which of the standard sizes approximates most nearly to the best trimming.

Even if, as in Fig. 1, the composition refuses to fit a standard size, we are not defeated. In such a case the negative is trimmed to the smallest standard size that will accommodate the part required, and the unwanted details that remain are masked off by strips of black paper gummed on. The "Enprint," when made, will have rather wide white margins, and the picture-area will be reduced a little in consequence, but all the advantages of trimming still remain.

Fig. 4. Here the boy is almost lost in a waste of waters. Trimmed size, 24×36 mm.

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

MOUNTING BY SPLICING.

SIR,—I do not remember having seen any reference to "Splicing" as a system of mounting prints in "The A.P."

Take paper same thickness as print, cut out space in this one-eighth inch smaller than the print, with a sharp knife trim both paper and print to a fine edge, paste, bring both together, rub down and press.

Result, print and mount same thickness all over.

Eighty to one hundred prints can be bound up into a book 1½ in. thick, which will close quite flat. What other system of mounting will produce this result?—Yours, etc.,

FRED L. BRAND.

PERFORMANCE OF CHEAP CAMERA.

SIR,—The f/2.9 cameras referred to in the September 1st issue by Mr. R. E. Dickinson hardly warrant the classification "cheap," but nevertheless, the points he raises are of great interest and worth much closer analysis. For example: Exactly *why* is the film with paper backing inferior to the perforated 24×36 ciné film? I do not know the complete answer to this, but I suggest that the following factors have an important bearing on the problem of obtaining a truly flat film.

(1) In the 24×36 miniature the film is gripped by the pressure plate over the full width of the perforations, instead of the narrow edge of about 1/16th width common on most other types. That may affect flatness.

(2) If the two film rollers are not truly parallel when the end of the cover-paper is first inserted there will be more tension along one edge than the other, which may tend to make the film bulge forward at the slacker edge.

(3) Cameras which snap to the "ready" must, by suction, pull the film out of the flat unless there is a positive means to equalise the air pressure at the back and front of the film itself. To wind on (or complete the winding on) before making an exposure instead of after, will neutralise this fault.

(4) Celluloid film appears to expand under heat much more than its backing-paper. If so, it calls for a new type of backing-paper—or none at all.

I agree with Mr. Dickinson's opinion that the normal folding camera cannot do justice to an f/3.5 lens when used wide open.—Yours, etc.,

J. V. GIL.

SIR,—The film accuracy position is only half as bad as Mr. Dickinson implies, since this 1/100th in. latitude is both sides of correct focus, and the percentage of exposures in which f/2.9 is used is extremely small, except in the case of a pressman specialising on night work.

May I suggest that as several makers are already supplying cameras with automatic counters for film motion in this size, a film of heavier celluloid equivalent in thickness to present film plus backing-paper, with paper leader and trailer would answer the purpose without any redesigning of transport arrangements. I would arrange a manually operated pressure plate behind the film to clamp it down in register when in position, as obviously this can give flatter surface than a spring-loaded pressure plate which remains in operation during film transport, and also the heavier celluloid will have less buckling tendency.

Now for the body. A die-cast box, with accurately machined film guides and helical focussing, will give and maintain accurate register over extended use, and still be, if not pocketable, considerably smaller and lighter than the twin-lens reflex. If a pocket camera is required, the four-strut press-type of front support will provide it, together with accurate parallelism of front and back for a long time. In either case, please let us have the lens and shutter recessed in the front for protection.

A camera as suggested should be producible with good fast lens and Compur shutter for under £10, and would be a precision job for the million.

I hope the first maker to try it will send me one.—Yours, etc.,

F. W. LONG.

SIR,—Mr. R. E. Dickinson's conclusions may be quite correct on paper, but I have found that my Baby Ikonta will give me 10-diameter enlargements at full aperture which will stand comparison with prints made from ¼-plate negatives.

There seems to me little merit in a small negative, but a great deal in a small camera, and until "precision" instruments can be made to be carried unobtrusively in the hip or side pocket as the Baby Ikonta can, I shall continue to put up with theoretical inaccuracy in the knowledge that the results will satisfy the most fastidious.—Yours, etc.,

E. E. TELFER.

FAIR PLAY FOR THE VERTICAL LINES.

SIR,—In reply to Mr. Wastell, I am not alone in the opinion that while the method of perspective drawing is convenient it is not accurate. Every perspective draughtsman finds "cooking" necessary near the edges of his picture, especially if he includes an angle of sight exceeding about 60 degrees. To give still greater accuracy the "picture plane" should be "concave," with the eye as radial centre, and all parallels would be very slightly barrel-shaped; but this is hardly a practical proposition. The rectilinear lens (as its name suggests) and later lenses are designed to overcome this barrel-shape to satisfy the eye which knows certain lines are straight and expects to see them so depicted.

In Mr. Wastell's proposition, having a thin rectangular object 200 ft. long at 80 ft. normal distance from the camera, he would like to see its sides parallel on a photograph. Extend the object to, say, a mile in length and find a wide-angle lens capable of grasping this—would he still like to see the extremities depicted to the same scale as the centre of the object? If not, at what point would convergence commence? In answer to his query, I would use a panoramic camera, and the result would be an elongated barrel.

Referring to Mr. Wastell's challenge—in a photograph of a building one can tell at a glance whether a rising front has been used, or its equivalent—part of the negative excluded from the print. If a camera be set level, with the lens in normal position, the horizon—to which all receding horizontals must converge—must be exactly at mid-height of the picture. If on the print the horizontals converge to a point lower than the centre, one of the fore-mentioned alternatives has been employed. The rising front or wide-angle lens is also easily detected by exaggerations at the top of the picture, such as at cornice projections, window reveals, etc.—Yours, etc.,

D. WEBSTER ROBERTSON.

SIR,—The following notes and comparisons may be of interest to Mr. Robertson and others who use stunt photography on the grounds that it resembles the image seen by the eye.

The eye has a curved field, i.e., the whole of the retina is the same distance from the lens.

The camera has a flat field, i.e., a lens is used that has been corrected (?) to throw a sharp image on to a flat surface, the edge of that image being much farther from the lens than the centre.

It will therefore be seen that as the tops of the chimneys which were placed parallel to the picture plane by Mr. Wastell get smaller, the longer focal length counteracts it by enlarging the image.

This proves that it is impossible to get an image with a camera that resembles that of the eye, even if the camera is tilted upwards.—Yours, etc.,

R. T. RAMSDEN.

A HOME-MADE MASK.

SIR,—I have a Zeiss Ikon Nettar 2½×3½ and made enclosed mask to fit before the films and held by the ends being turned down under the polished rods of the spool-chambers. (The cockroaches have enjoyed a part of it.)

My new one, now in use, is made of the red and black backing of Verichrome film, with the black side towards the lens. When the hand appears I wind to the *first dot* and snap, then to 1 and snap again. And so dot and number, dot and number till 7. Then I count revolutions to dot and to 8 and on this data I roll along and get 17 pictures, unless I make mistakes.

—Yours, etc.,

C. COOKSEY.
(Barbados.)

INTO THE EYE of the SUN

By J. F. RIMMER.

Evening and into-the-light effects are among the most striking that photography can record, and are not difficult to take provided that a few necessary precautions are taken.

SAILING INTO THE SUN Generous exposure, followed by curtailed or water-bath development, is called for here.

AT this time of the year some extremely interesting and often beautiful effects may be obtained by taking photographs directly into the sun.

Some form of sky-shade must be used, but although the regular use of a lens hood is a good habit, there is no real need to purchase expensive accessories. All the photographs reproduced here were taken looking right into the sun, with an ordinary magazine held above the lens to prevent the rays of the sun from striking directly on to the lens. A certain amount of practice is needed to hold the paper, view the subject and press the shutter release simultaneously, but a willing friend can help a great deal

by holding the magazine. The paper or other object should be held so as to drop a shadow directly on the lens, but high enough to give an unobstructed view in the finder.

Except where there are strong clouds, it is essential that the sun should be shining, as without it the effect is often completely lost. After about five o'clock the sun will probably be so low that it will appear in the viewfinder and not above the top edge of the picture as was the case in all but the last of the examples herewith. In the absence of clouds the only alternative then is to find some convenient tree or building to screen the sun's light.

Generally this is

equivalent to turning a little to left or right and the principle is not then the same, as the picture is not taken straight into the sun, and figures, etc., would be rendered in the ordinary way and not as silhouettes.

In this kind of picture water

makes an appeal which is greater than ever. The sparkle of the sun on water is very effective, but don't be disappointed with your negatives until you have made prints of them. For pictures of the silhouette type the negatives should be thin and contrasty with practically no detail in the shadows.

For silhouettes the exposure required is much less than for the same subject with the sun behind the camera. Consequently, full use may be made of an appropriate colour filter to obtain a good rendering of whatever clouds are available.

Pictures such as that of the yacht, on the other hand, in which it is required to retain detail on the shadow side, require rather a longer exposure than the normal, and development absolutely must be short. Water-bath development, if the negatives can be treated individually, is a great help for such subjects.

EVENING. For such subjects as this a fairly brief exposure, yielding a thin negative, is suitable.

Sectional view of camera from right side. Showing general construction, and particularly the film-pack holder.

AN advertisement in "The A.P." offering 3-in. f/2 anastigmats by Bausch & Lomb, complete with Ilex shutter, for less than three pounds. Who could resist that? Not I, at least, for apertures as wide as that have always excited my imagination; they open up such vast fields of new work. So I bought one of them, without thinking overmuch of how I should use it. There is quite a kick in just possessing an f/2 lens.

Making a Camera.

After a while I began to wonder what on earth I could do with it. Then I remembered the tense excitement when I made my first pictures with a pinhole camera of cunning device and crude workmanship. If I could make a camera then, I could now. I was already getting worked up with the idea. My brain was being jostled here and there with all sorts of ideas.

The thing was to marry my lens to a suitable box. So, having put on my thinking cap (velvet-lined) and made a few sketches (many-lined), I ultimately evolved a design simple enough to be made with two shillings' worth of tool kit from the 3d. and 6d. stores and about ninepennyworth of materials from the same source.

The camera body was made from $\frac{1}{2}$ -in. thick plywood, and is simply a box sliding inside another box. The sectional drawings explain the general construction and contain detail enough to put on the right track anyone who is mechanic enough to make the camera at all.

Sectional view of camera seen from the front. Showing mechanism of focussing adjustment.

Making Use of a Bargain Lens

The film-pack adapters, of which I made two—one for monochrome and one for colour—entailed more thought than mechanical skill, and were made from brass curtain runner of "ideal" section, supplied by our accommodating universal provider. To be sufficiently strong the corners and cross strip had to be dovetailed and sweated.

Ready for Test.

By working every minute of my spare time, the camera was ready for test two days before my departure on holiday.

The finished camera, showing view-finder and focussing scale.

Tremulously I inserted a valuable film pack and took the newly-completed toy with me to business. During the lunch hour I defiantly fired off the shutter at anything that held the remotest possibilities of a picture. I used up the twelve exposures, and then, removing the film-pack adapter, I toasted it in the sun for the remainder of the afternoon to test for fogging.

The reason I had chosen film pack was because it is a simple and quick operation to change over from monochrome to colour. Besides, film packs are so very convenient when on holiday, even if they are a little more expensive.

Under normal circumstances, the true photographer's heart beats a little faster as he crosses the threshold of his dark-room, so my feelings may be imagined when, with one

day left before the holidays, I had a dozen pan. film-packs and half a dozen colour film-packs reposing in my case, all hanging in the balance on the result of my "ultra-modern miniature."

Homeward bound, along the Great West Road, my speedometer hovered around the 65 mark. Arriving home, dinner could wait, development was all-important.

As this was a 'chrome film the red light could be used—a luxury in these days of panchromatism.

The First Results.

Peering anxiously at the films in the red light I saw first a dark patch and then, by slow degrees, the whole image. My fears and tremors had all been groundless, for in the first batch of negatives I had one or two as good if not better than any I had previously obtained with the most expensive modern precision cameras or press reflexes. One or two were slightly fogged, so as a quick cure for this I screwed a suspender (gent's black) on the back of the camera, so that it was a moment's work to hook it over the end of the film-pack adapter. I carried the camera throughout my holiday with the suspender gallantly doing its work. But on taking it out on a photographic club outing my fellow members were so indignant that I was forced to remove the offending appendage and do the job properly.

I even equipped my new baby with a lens hood; it was made from cardboard and covered with black velvet, two "pop-eye" fasteners holding it in place. The accompanying illustrations will give some idea of the appearance and size of the finished camera, which I am now getting anxious to try, at full aperture, on winter subjects. "CYCLOPS."

Another view of camera with one side uncovered to show focussing mechanism.

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

The Tripod in Cinematography By SIGURD MOIR.

ONE of the essentials of successful ciné-photography is a picture that will not ultimately flit and jump about on the screen. It should show movement in the "action" portions only, and no other part of the setting should shift its position until the requirements of production technique indicate a panoram or an "approach" or some other shot in which it is perfectly legitimate to move the camera.

Steadiness Necessary.

Not always, however, are adequate precautions taken to keep the camera quite steady during the shooting. Indeed, if we are to judge at all by the many Press photographs depicting charming young ladies in the act of using their sub-standard cameras, it would seem that any easy poise of the body—with the camera held some two inches from the cheekbone—is the normal stance for shooting. Perhaps it is normal—but it is quite certainly wrong. Even our "still" colleagues find no little difficulty in steadying their unsupported instruments for spaces as brief as one-tenth of a second, hence it is obvious that a lengthy scene filmed in this manner would cease to satisfy the beginner just as soon as he had outlived the novelty of the thing.

The only successful alternative is, of course, the use of a support, and although this can often be improvised from a near-by tree or adjacent fencing there is no doubt that the only satisfactory and permanent solution to the problem is a folding tripod.

Essential Qualities.

Most of the advantages in the use of a tripod stand are rather obvious. Body wave is no longer a threatening possibility, and even after long spells of filming the camera-man is still in possession of uncramped wrists and forearms. Then the tendency to jerky movement ordinarily initiated by the motor drive is more effectively overcome, whilst any spring rewinds necessitated during the filming can be performed without the need for changing either the position of the "set" or of the background.

However, the ciné-tripod is intended to fulfil several less obvious functions, and for this reason we must see that the accessory of our choice is possessed of certain qualities which are essential to its good performance. It must, for instance, be firm and rigid when erected; and it must be capable of erection to both high and low viewpoints without prejudice to its ordinary stability.

Then it must possess the fullest possible movement in the head for panoraming and tilting purposes, whilst the head itself should be fitted with a large-winged and easily accessible screw to facilitate the work of fixing and removing the camera.

Nor should ease and comfort in travelling be forgotten. Most of the cinema tripods now on the market are made to fold neatly into the most convenient space—and are, moreover, sensibly constructed with a view to obtaining the maximum of efficiency from the inconsiderable weight of metal used.

Using the Tripod.

It will be seen that any tripod possessing the essential characteristics outlined above should be able to stand the strain of ordinary and even of emergency work without requiring constant care and attention from the already harassed camera-man. Once set up, it should stay rigidly in position until the requirements of further action render a change of position necessary.

Notwithstanding this, no tripod can behave satisfactorily in the face of careless setting or adjustment. The attachment screw must, for example, be turned tightly home in order that the camera itself may be firmly retained in

position; and, for the same reason, both the tilting and panoraming controls should be securely locked until such time as the relative movements are intended to come into action.

Setting Up the Tripod.

Then the greatest care should be paid to setting up the tripod legs. These, if of the reversible or "alternative-end" pattern, should be arranged with particular regard for the nature of the surface upon which it is intended to operate the tripod. Marble and highly-polished floors are frequently a source of considerable annoyance to the cinematographer, and these may be tackled most effectively by using the blunted or rubber ends of the legs—taking care, where these do not exist, to fit bored corks or rubber bungs over the familiar spiked "feet."

The same arrangement answers very well when working upon gravel and other rough surfaces, though here the spiked or ordinary ends will be found not only to operate with at least equal efficiency, but also to preserve the rubber for use in other contingencies.

When handling the tripod for height adjustments, it is best to have the telescopic legs quite loose—with the

Cinematographers who require a football sequence for a film should get to work soon, while the afternoon light is still strong. Confusing backgrounds, the bane of the still photographer, matter but little to the ciné camera, as the players always stand out well by virtue of their movement.

weight of the camera supported from beneath the tripod head with the left hand. The three legs may then be conveniently splayed and quickly locked in position with the free hand, remaining unweighted until the last.

In some situations, of course, it is found impossible to secure a uniform spacing of the legs, and here the adjustment must be so made that the horizontal axis of the camera does not alter even when the tripod head is panoramed through the full scope of the movement.

Working from low viewpoints is particularly difficult when using a non-adjustable tripod or when the legs of the telescopic variety are extended to their extreme limit. It is always best, in such circumstances, to work with the legs compressed as far as possible, for

not only will the risk of a collapse be considerably lessened but there will be much more space for the camera-man and his assistants to manoeuvre about the instrument.

Proper Care.

Considering the good service it is able to render the intelligent user, it is remarkable that the tripod does not come in for more careful handling and much gentler treatment. It is no exaggeration to say that—on location, at least—the instrument is more often than not kicked into position, whilst on both outward and return journeys it is no unusual thing to find the tripod indiscriminately bundled up with any collection of harmful and scratchy paraphernalia.

Such treatment indicates only too well the scant respect which the amateurs concerned have for one of the most important articles in their whole equipment. It also shows to some extent why troubles with the tripod are not entirely unknown—even in these days of robust and still more robust construction.

Let us, then, decide to treat the instrument with all the care that it deserves. It should be no difficult matter to arrange for a member of the production unit to act as tripod bearer—both to and from the location, whilst the storage-bag normally supplied with the tripod will preserve it during periods of inactivity.

For the rest, it will usually be found sufficient to keep the instrument clean and lubricated with graphite at the friction faces.

The Week's Meetings

Thursday, September 16th.

Camberwell C.C. Magazine No. 4.
Kinning Park Co-op. C.C. Beginners—Bring Prints for Advice.
Nottingham and Notts P.S. Clifton Hall. (South Notts Bus 2.20.)
Oldham P.S. "Architecture." T. Burton.

Friday, September 17th.

Folkestone C.C. "Indoor Photography."
R.P.S. "With a Camera in the Antarctic." A. Saunders.

Saturday, September 18th.

Accrington C.C. Belthorn.
Bath P.S. Little known Bath.
Blackpool and Fylde P.S. Salmsbury. H. D. Keighley.
Bristol P.S. Old Clevedon.
Hackney P.S. The Ching Brook.
Hull P.S. Little Weighton to Beverley.
Kinning Park Co-op. C.C. Braidwood—Fiddlers' Glen.
Letchworth C.C. William (Walk).
Liverpool A.P.A. Helsby Hills.
Luton and D.C.C. Avot St. Peter.
Northamptonshire N.H.S.P.S. Photographic Alliance "Red Book" Day.
Sheffield P.S. Derbyshire Dales.
Singer C.C. Renton to Cardross.
S. Suburban and Catford P.S. "Red Book" Day at R.P.S.
Stafford P.S. Old Stafford Society Outing.

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Saturday, September 18th (contd.).

Stockport P.S. Ladybrook—Bramhall.
Worcestershire C.C. Opening of Exhibition.

Sunday, September 19th.

Harpden and D.P. and C.S. Burnham Beeches.
N. Middlesex P.S. Sonning and Wargrave.

Monday, September 20th.

Bayswater and Paddington P.S. Annual Exhibition.
Oldham Equitable P.S. "Slide-Making." J. Stubbins.
Southampton C.C. Outing to Messrs. Chandler's Photographic Studios.
Stourbridge I.P.S. Competition. Subject Optional. Exhibition Entries.

Tuesday, September 21st.

Bradford Junior P.C. Mr. Marshall and his Folio.
Hackney P.S. Special Sale.
Manchester A.P.S. "Through Yugoslavia with a Camera." W. E. Hughes.
Royal P.S. Exhibition Lantern Slide Night.
Windlesham C.C. "Bromesko." (Kodak).
Worthing C.C. General Meeting. Competition Entries.

Wednesday, September 22nd.

Mountain Ash C.C. Beginners' Mistakes.
S. Essex C.C. Bansall Shield and E.A.F. Mixed Subject Folios.

Exhibitions and Competitions

CURRENT AND FUTURE.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, September 30. Rules in the issue of August 25.

The Amateur Photographer Novices' Competition.—Special prizes of supplies of films. Latest date for entries, September 30. Particulars in this issue.

Wallace Heaton Competition. Cash prizes every week.—Open to readers of *The Amateur Photographer*. Full particulars in advertisement page in this issue.

Nuro Competition.—Cash prizes every month. Special prizes for boys and girls under sixteen. Full particulars obtainable from any photographic dealer, or from Nuro Ltd., Biggleswade, Bedfordshire.

Isle of Man Sixth Annual Amateur Photographic Competition, £300 cash prizes.—Open until September 30. (P. A. Clague, Publicity Department, Isle of Man.)

"Daily Mirror" "Nushots" Weekly Photographic Competition. Cash prizes. (The Editor, "Daily Mirror," Fetter Lane, London, E.C.4.)

XVle Salon International de Photographie de Belgique.—Open, May–October. (M. Julien Lejeune, 70, Av. Van Becelaere, Boitsfort, Brussels.)

Eighth Chicago International Salon of Photography.—Open, July 15–September 19. (Alex. J. Krupy, Chicago Camera Club, 137, North Wabash Avenue, Chicago, Illinois, U.S.A.)

XXXIle Salon International d'Art Photographique de Paris.—Open, October 2–17. (Le Secrétaire, Société Française de Photographie et de Cinématographie, 51, Rue de Clichy, Paris (9e).)

I International Exhibition of the Photo-Press and Literature (Jugoslavia).—Open, October. (Fotoklub Zagreb, Masarykova II, Zagreb, Yugoslavia.)

Royal Photographic Society of Great Britain, 82nd Annual Exhibition.—Open, September 11–October 9. (The Secretary, Royal Photographic Society, 35, Russell Square, W.C.1.)

Professional Photographers' Association Annual Exhibition, Princes Galleries, Piccadilly, W. "Camera Portraits"—September 3 to September 15. "Photography in Commerce and Industry"—September 17 to September 29.

3e Internationale Focus Fotosalon, Amsterdam. Holland.—Open, September 11–26. (Focus, Ltd., Fotosalon, Bloemendaal, Holland.)

Second Western Ontario Salon of Photography.—Open, September 13–18. (A. E. Adams, 923, Maitland Street, London, Canada.)

London Salon of Photography.—Open, September 11–October 9. (The Honorary Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.)

Fifth Annual Salon, Rockville Centre, N.Y.—Open, September 11–18. (Dr. M. F. Lee, 74, N. Long Beach Road, Rockville Centre, N.Y.)

Anthracite Salon of Photography, Everhart Museum, Scranton, Penna, U.S.A.—Open, September 18–October 4. (Salon Director Everhart Museum, Scranton, Penna, U.S.A.)

The Victorian International Salon.—Open, October 18–30. (C. Stuart Tompkins, The Junction, Camberwell, E.6, Victoria, Australia.)

International Photographic Exhibition, Budapest.—Entries, September 20; open, October. (Modern Magyar Fényképezők, VIII, Rákóczi-ut 19, Budapest, Hungary.)

Windlesham Camera Club.—Open, October 21–23. Last day for entries, October 2. (J. C. Hayward, Hallgrove, Bagshot, Surrey.)

Fourth Canadian International Salon of Photographic Art.—Open, October 23–November 15. (Exhibition Secretary, Canadian International Salon of Photographic Art, The National Gallery of Canada, Ottawa, Canada.)

Rotherham Photographic Society Forty-eighth Annual International Exhibition.—Entries, September 20; open, October 12–16 inclusive. (E. G. Alderman, Ruardean, Newton Street, Rotherham, Yorks.)

Sixth Irish Salon of Photography.—Entries, September 25; open, October 30–November 6. (The Hon. Secretary, 18, Morehampton Road, Dublin.)

"Irish Travel" Photographic Competition, 1937. Cash prizes.—Entries, September 30. (The General

Manager (Photo Competition), Irish Tourist Association, 14, Upper O'Connell Street, Dublin, I.F.S.)

Cyclists' Touring Club (Metropolitan D.A.) Second Annual Photographic Competition.—Entries, September 30; open, October 28–30. (G. H. Craddock, 9, Lady Margaret Road, Kentish Town, N.W.5.)

Lincoln C.C. Eleventh Annual Open Exhibition.—Entries, October 1; open, October 29–November 26. (Miss E. Redfern, 8, Cecil Street, Lincoln.)

G.E.C. (Coventry) P.S. 4th Annual Exhibition.—Entries, October 14; open, November 8–13. (C. W. Crowe, G.E.C. (Coventry) Photographic Society, General Electric Co., Ltd., Coventry.)

International Salon Oval Table Society, Inc.—Entries, October 23; open, November 16–30. (Oval Table Society, Inc., 10, W. 23rd Street, New York.)

1st Rhode Island National Salon of Photography.—Entries, November 1; open, November 15–30. (J. Clement Grimes, 103, Westminster Street, Providence, Rhode Island, U.S.A.)

International Photographic Exhibition in Debrecen (Hungary).—Entries, November 20; open, January. (Aszmann Ferenc, Ferenc Josef ut 27, Debrecen, Hungary.)

XIe Internationale Fotosalon "Iris".—Open, January, 1938; last day for prints and entry forms, November 30, 1937. (F. Geeraerts, Brederodestr. 22, Antwerp, Belgium.)

Second Indian International Salon of Photographic Art.—Entries, January 15; open, March, 1938. (N. B. Cooper, Hon. Sec., Camera Pictorialists of Bombay, 53, Nicol Road, Ballard Estate, Bombay, India.)

Leicester and Leicestershire Photographic Society's International Exhibition of Pictorial Photography.—February 21–March 12, 1938. Last day for entries, January 29, 1938. (H. Foscutt, 19, Doncaster Road, Leicester.)

Edinburgh Photographic Society 76th Annual Open Exhibition.—Open, March 9–April 2. Entries, February 28. (John S. Rodger, 16, Royal Terrace, Edinburgh.)

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS

A second exhibition of pictures by F. J. Mortimer was opened last week at the Camera Club, 17, John Street, Adelphi, W.C.2. This collection consists almost entirely of yachting and battleship subjects. The show is open to the public for a month. Admission is free on signing the visitors' book.

The 76th Annual Open Exhibition of the Edinburgh Photographic Society will be held in the Society's Rooms, 16, Royal Terrace, Edinburgh, from March 19th to April 2nd, 1938. The closing date for entries is Monday, February 28th, 1938. There are four classes: 1, Portraiture and Life; 2, Landscape and General; 3, Lantern Slides; 4, Colour Transparencies. An entry fee of 2s. 6d. will be charged, which covers five prints (or sets of four lantern slides or transparencies). A few entry forms are available at these offices, or from the Hon. Exhibition Secretary, John S. Rodger, at the above address.

The Coronet Camera Company, 310, Summer Lane, Birmingham, 19, inform us that in future the prices of the 9.5-mm. projectors are as follows: Hand-driven Model, £7 7s.; Motor-driven Model, £9 17s. 6d. Both these are supplied complete with super-reel attachment and with necessary resistances, no further purchase of supplementary parts being necessary.

An Exhibition of Photographs by members of the Leith Camera Club will be open during September in the Art Library, at the Central Library, George IV Bridge, Edinburgh. The exhibition will be open daily from 10 a.m. to 9 p.m. Admission is free.

The latest additions to the range of Ditmar ciné cameras are equipped with a built-in photo-electric exposure meter of semi-automatic type. In use, a knob controlling a resistance is set to the speed of the film with which the camera is loaded, after which the needle of the exposure meter points to the lens-aperture which should be used to ensure correct exposure of the subject at which the camera is aimed. A very important feature is that the indications of the meter and a scale showing at any moment the aperture at which the lens is set are both visible in the view-finder. Since the aperture is controlled by a sliding knob so placed as to be conveniently accessible with the camera in use, it is easy not only to check, but to adjust the exposure as required while actually filming a scene. This is of very great value in panning or tracking shots, where the luminosity of different parts of the scene may not be the same. Cameras fitted with this new improvement, which should remove the last

excuse for incorrect exposure, are offered, with fixed-focus f/2.8 Hermagis lens, at the following prices: 8-mm. size, for 25-ft. double-run spools (lens f/2.5), £26 10s.; 9.5-mm. camera, for 30-ft. chargers, £25; 9.5 or 16 mm. camera, for 50-ft. spools, £27 10s. Models with the same and other lenses in focussing mounts are also available at slightly enhanced prices. These new models can be obtained through any dealer, but for further information the interested reader should apply to the sole concessionaires, Messrs. Actina Ltd., 29, Red Lion Square, W.C.1.

So many educational authorities have decided to use "talkies" in the classroom during the coming school year that Gaumont-British Instructional Ltd. are increasing their current programme by fifty per cent. At present Great Britain lags far behind other countries in applying the film to education, there being in this country only about 1,000 schools using projectors as against 9,400 in France, 17,000 in Germany, and 10,000 in America. Nevertheless G.B.I. hope to distribute at least 25,000 reels of educational film this year, on subjects ranging from geology and natural history to physical training. Teachers and others interested should write to Gaumont-British Instructional

Ltd., at Film House, Wardour Street, W.1, for details of these and other films.

Mr. C. H. Bailey, "Aber," Birchin Lane, Nantwich, Ches., is the latest winner of the Wallace Heaton "Happy Holidays" competition, and has been awarded the usual weekly prize of one guinea. Full particulars of these competitions appear regularly in our advertisement columns.

IT IS A SLEEPING DOG.

WHAT IS THIS ?

(Solution to the puzzle-picture on page 305.)

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. The series from No. 1 to 61 included all standard chemical and optical formulæ and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulæ issued by the leading manufacturers of plates, films and papers.

These facts and formulae are intended to be cut out and pasted on the thin cards of the standard size, 5 x 3, supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is 5½ x 3½ x 3 and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

92. Makers' Formulæ: Developers for Gevaert Papers—(2)

G. 254. Extra-Contrasty Developer.

Potassium hydroxide 220 grs. (25 grm.)
Sodium sulphite (anhydrous) .. 880 grs. (100 grm.)
Potassium bromide .. 27 grs. (3 grm.)
Hydroquinone .. 480 grs. (55 grm.)
Water to .. 20 oz. (1,000 c.c.)
If crystallised sulphite is used, take double above quantity.

This developer is intended for photo-technical papers only, and gives maximum contrast. Time of development, 90-120 secs.

G. 252. Blue-Black Tones on Ridax.

Metol .. 22½ grs. (2.5 grm.)
Sodium sulphite (anhydrous) .. 220 grs. (25 grm.)
Hydroquinone .. 54 grs. (6 grm.)
Sodium carbonate (anhydrous) .. 358 grs. (41 grm.)
Potassium bromide .. 4½ grs. (0.5 grm.)
Water up to .. 20 oz. (1,000 c.c.)
If crystallised sodium sulphite is used, take double quantity shown. If crystallised sodium carbonate is used, take 880 grs. (100 grm.)

This developer yields intense blue-black tones on Ridax paper.

G. 262. Rapid Warm-Tone Developer.

Hydroquinone .. 220 grs. (25 grm.)
Sodium sulphite (anhydrous) .. 620 grs. (70 grm.)
Sodium carbonate (anhydrous) .. 296 grs. (33.5 grm.)
Potassium bromide .. 18 grs. (2 grm.)
Water to .. 20 oz. (1,000 c.c.)

If crystallised sulphite is used, take double the quantity shown. If crystallised carbonate is used, take 800 grs. (91 grm.)

This developer yields tones ranging from warm-black to red on Vittex D and Prestona. It is diluted with 2 to 6 parts of water according to the tone required, and development takes 2 to 6 minutes at 65 degrees. G. 262 is less consistent with respect to tone produced than is G. 261.

Exposure required is from 1½ to 4 times that needed for black prints with G. 251; that is, about half that required when using G. 261 for warm tones.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a *separate* stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Sky Filter.

I have just bought a sky-filter, and notice that the colouring on it is graduated, one end being darker than the other. How do I use it, please?
F. R. L. (Wembley.)

The sky-filter should be placed on the front of the lens with the darkest part at the top. What effect it will have depends upon its distance from the lens, but the object of such a filter is to cut down the light from the sky portion of the subject. It follows that objects coming against the sky will also be given a reduced exposure.

A Misunderstanding.

I took a film to be developed, and when I called to collect it I found the firm had made prints. They claim that I should pay for these, which I have declined to do, since I did not order them and do not want them. They say I did not specify "developing only," and refuse to return my film unless I pay for the unwanted prints. Are they in the right in withholding it?
H. B. (London.)

In the absence of witnesses we do not see how the dealer can prove that you ordered prints, or that you can prove that you did not. In our opinion, however, the dealer has no right to retain your film. All he can do legally is to try to prove that you ordered prints and to recover the money due for them.

Hinging Prints into Album.

I want to mount some prints in an album, in such a way that they can be turned over to read any notes there may be on the back of them. Mounts such as those used for fixing stamps would suit my purpose; where can these be obtained?
E. J. H. (Uxbridge.)

It is difficult to see how you can mount your prints satisfactorily and yet permit of their being turned over. The only way we can suggest is that you should make hinges of some thin fabric or tough paper and attach one half to the back of the print and the other half to the leaf of the album. Ordinary stamp hinges would, we fear, not be sufficiently robust.

Inside Churches.

Is there any law, unwritten or otherwise, with regard to photography in churches? I have photographed many into which I have gone as a visitor, and would like to enter one or two prints in competitions. This, however, might lead to publication, and I do not wish to put myself in the wrong by allowing this. D. F. L. (Salford.)

It is always advisable to obtain permission from the vergier or vicar when taking photographs inside a church, if only as a matter of courtesy. Generally, we have found that no objection is raised, but if anyone in authority can be found it is better to ask.

We think, however, that photography inside the cathedrals is generally forbidden, but again you might apply to the vergier.

Black Ring on Films.

Can you tell me the cause of the black ring of fog on the enclosed negatives? The shutter has been examined by a local firm and pronounced in good order. H. V. G. (Weston-super-Mare.)

Without examining your camera we cannot say definitely what is the cause of the trouble with your negatives. But your negatives strongly suggest that some part of the lens mount, which should, of course, be dead black, has lost its paint with wear, and so has become bright. The resulting reflections would produce markings of the type that your negatives show.

Correction Filters.

It appears that the aim of a correction filter used with panchromatic materials is to even up sensitivity so that the spectrum becomes nearly a straight line. Yet the curve of visual luminosity is anything but straight, and has a strongly-marked maximum in the green-yellow. Can you reconcile these facts? C. D. S. (Southampton.)

You are in error in supposing that the aim of a filter is to make the spectrum a straight line. The perfect filter would re-shape the colour-response curve of the film to match exactly the curve of visual luminosity.

Double Exposure.

Can you explain the haziness of the enclosed photograph? At first I thought it was camera-shake, but the clearness of the lettering on the posters seems to contradict this.

A. F. M. (Cheshire.)

Your photograph shows distinct double exposure, although the camera must have been kept still for part of the time in order to get good definition on the posters. Superimposed on the sharp image is at least one blurred image of the same posters, which may have impressed themselves on the film during the same exposure or during a second unintentional one. Some shutters open if the setting lever is released when it has all but completed its travel; is this a possible explanation? Or did the setting-lever catch on your finger as it flew back? Or was the shutter set at "Bulb"? Any of these might produce a result such as that you send.

V.P. with Range-finder.

Can you tell me of a camera that fits the following specification: To use V.P. roll film, 8 or less exposures on spool, coupled range-finder, f/3.5 lens in Compur shutter. I should have thought this was a normal small camera, but I cannot find one. Is one made, or likely to be made?
P. V. B. (London.)

To the best of our knowledge, no camera using 8-exposure V.P. film and fitted with a coupled range-finder is made.

Practically the same size of picture, however, is obtainable in the various 16-on-3½ x 2½ cameras, and several of these are fitted with range-finders. Owing to the fact that 16 exposures in this type of camera cost no more than 8 taken on V.P. film, the latter size is less popular than it once was. We have not heard that any manufacturer plans to bring out the exact type of camera for which you ask.

Making a Spotlight.

I want to make myself a spotlight giving, as nearly as possible, a parallel beam of light. Several condenser lenses are available, and if special bulbs are needed these could no doubt be obtained. How should I use the lenses and what kind of bulbs do I need? H. M. D. (Bournemouth.)

For obtaining a parallel beam of light the source of light should be placed at a distance from the lens equal to its focal length, and the light should emanate as nearly as possible from a point. We advise you to experiment with clear gas-filled bulbs, and to replace these with special projection bulbs if you find it desirable to have an even smaller source of light.

A Focussing Query.

I have worked out the hyperfocal distance for my lens as about 70 ft., but my camera will focus on distances greater than that. Under what circumstances would one focus on distances greater than the hyperfocal distance?
E. J. B. (Chiswick.)

A camera is focussed on distances beyond the hyperfocal distance when it is required to photograph objects at infinity as sharp as the lens can render them. With the lens fixed on the hyperfocal distance objects at infinity are not truly sharp in the theoretical sense, but only passably sharp within whatever limits have been set in calculating the hyperfocal distance.

THE new Compass Roll-Film Back can be interchanged with the standard hinged back (for glass plates) in a second or two. It holds its own miniature roll-film of 6 exposures—a most convenient number. It has positive one-turn-per-picture winding and a retracting pressure plate. The thickness of the camera is increased only $\frac{1}{4}$ inch. Two types of film are available, Selochrome at $1/6$ for two six-exposure spools and Selo Fine Grain Panchromatic at $1/9$ for two six-exposure spools.

Compass Roll-Film Back £5 · 0 · 0

● WRITE for the 48pp. illustrated Compass booklet. Appointed Compass Dealers will gladly demonstrate the Compass Camera and the new Roll-Film Back.

PURMA SPECIAL

THE BEGINNER'S MINIATURE

Ordinarily, to take successful action and high-speed subjects needs some photographic experience and skill. But anyone can get successful action pictures (or any other kind) with a PURMA SPECIAL. Its very special design eliminates focussing, lens and shutter speed setting, and does away with all kinds of calculations. All you have to do is hold up the camera and shoot. The adjustment of the three speeds, 1/25th, 1/150th and 1/450th, is **automatic**—decided by one of three ways of holding the camera. From each roll of ordinary V.P. film costing 1/- you will get 16 clear, sparkling pictures—action—landscape—indoors—and (with a simple attachment) portraits. Fitted f/6.3 Beck lens. With the PURMA SPECIAL you can indulge in the most enjoyable miniature photography at the least expense. For the PURMA SPECIAL camera costs

Actual size of contact print.
Taken 11.30 a.m., winter sunlight,
panchromatic film, medium speed

**NOW READY.—A new book which will help
you to get the best results with your camera!**

Brighter Photography

by DAVID CHARLES, F.R.P.S.

This handy book reveals in a clear, attractive way the secrets of successful photography. Though primarily intended for the novice, it is invaluable to every keen camera user.

The carefully arranged chapters cover the whole field from the choosing of a camera to developing and printing the finished picture. Details of the various photographic materials on the market are given, and there are important sections dealing with Focussing, Aiming the Camera, Photographic Groups, Lighting and Exposing.

In addition there are over one hundred and sixty illustrations, each numbered and each conveying a really useful hint. By simple cross references these illustrations provide a series of clear, concise lessons in the art of making better pictures.

Walbeck 9832. 85, BAKER ST., W.1 Business: 9 a.m.—7 p.m.

"... IN ADDITION THE CAMERA IS VERY CONVENIENT TO OPERATE AND IS PROVING VERY SATISFACTORY IN EVERY WAY..."

This extract from a letter spontaneously written by a customer who purchased a Super Baldina from us a few weeks back, reflects our own impression that it is an excellent proposition for the man who wants a perfect 35-mm. camera at a medium price. We are specially struck with the parallax compensating view-finder and the smooth rapid focussing. All models fitted with first-class lenses in Compur shutters.

SUPER BALDINA

With coupled range-finder, automatic coupling and film-locking, helical focussing.

F/2.9 Trioplan, Compur to 1/300th.....	£13 5 0
F/2.8 Tessar, ditto.....	£18 10 0
F/2 Schneider Xenon, Compur to 1/500th.....	£19 19 0
Ever-ready Case.....	£1 5 0

A good enlarger is essential when working from small negatives. We have a very full selection and specially draw attention to the "Rajah," which is of faultless finish and performance. With several unique features, we are specially attracted by the film carrier and general optical arrangement.

RAJAH Model 0,
For 35-mm. and half-V.P.,

[0025]

RANGE-FINDER VAUXHALL MINICAM

TAKES 12 OR 16 PICTURES ON STANDARD $3\frac{1}{2} \times 2\frac{1}{2}$ FILM

FINEST MOROCCO LEATHER COVERING

THE CAMERA COMPANY are proud to announce this exclusive new Vauxhall Super-Minicam with Coupled Range-finder.

Here is a coupled range-finder miniature, fitted with the finest quality f/2.9 anastigmat lens in delayed-action Compur shutter, selling at a price which YOU can afford. Actually its nearest competitor is approximately 40 per cent higher priced—BUT the Vauxhall has numerous advantages not to be found in other cameras of this type.

For instance, it takes two sizes of picture according to choice—either twelve $2\frac{1}{2}$ in. square or 16 $2\frac{1}{2} \times 1\frac{1}{2}$ in. Another exclusive feature is the special radial focussing lever which automatically springs back into the infinity position when the camera is closed, thus preventing any possible damage to the camera or focussing mechanism.

PRICE £11 15s. ONLY

Yours for 20/7 down and eleven similar monthly payments.

★ SEND FOR LEAFLET ★

STANDARD MINICAM

(without Coupled Range-finder)

This popular model is of similar construction and specification as the above Super-Minicam, with the exception that it has a direct-vision optical view-finder at the side in place of the coupled range-finder. Also micrometer lens focussing is fitted instead of the radial focussing lever.

PRICES.

$2\frac{1}{2}$ square or V.P., f/2.9 anastigmat, Compur shutter **£6 : 19 : 6**

(Or under our SELF-FINANCED Hire Purchase Terms of 12 monthly payments of 12/3.)

Ditto, with Prontor II shutter **£5 : 19 : 6**

(Or under our SELF-FINANCED Hire Purchase Terms of 12 monthly payments of 10/6.)

The AMATEUR ^{4^D} PHOTOGRAPHER & CINEMATOPHOTOGRAPHER

Vol. LXXXIV.

Wednesday, September 22nd, 1937.

No. 2550.

SPECIAL AUTUMN NUMBER •

SEP 30 1937

THE NEW AUTOMATIC **Rolleiflex** WITH THESE AMAZING NEW FEATURES

Automatic film wind, which in one action automatically sets the shutter, prevents double or blank exposures, sets the built-in self-timer for delayed action. (No ruby window is fitted—the film loading being automatic.) Larger aperture finder lens. Improved controls for greater ease and speed, and a peep window which shows the shutter and lens aperture readings in magnified form by means of a cylinder lens. Reflex hood fitted with large magnifier—for taking pictures at eye-level the object is viewed through a mirror and double magnifier combined. This new 6×6 model embodies all the well-known Rolleiflex features, including 12 pictures $2\frac{1}{2} \times 2\frac{1}{2}$ on $3\frac{1}{2} \times 2\frac{1}{2}$ roll film for 1/-. Seeing your picture, full size, right way-up all the time on the focussing screen, etc., etc. Compur Rapid shutter speeded to 1/500th sec. and Bulb, with Zeiss Tessar f/3.5 lens. Price £31. 5 0. Ever-ready case, £1 17 6.

Beginning new series of newsy notes on matters of photographic interest.

**How to give 'tone' to your pictures**

A picture that's good when it's small is *better* when it's BIG. Agreed! But the question of what paper to enlarge upon is all-important. For many subjects—particularly landscapes and portraits—you need those lovely warm tones that infuse sunlight into a picture, make it 'rich'-looking and distinguished. And such an effect used to be rather troublesome to get, especially in enlargements. Now it's easy.

"Bromesko," the *warm-toned* Bromide paper gives you these admired tones straight away, by direct development. Yet it involves no sacrifice of the speed and easy manipulation hitherto associated exclusively with papers giving a cold black image. It is, in fact, a positive revolution! Enlarge your best pictures on this unique paper and see how very good they can be.

The assorted 8½" x 6½" packets provide the best way of trying out "Bromesko." There are four assortments; each contains 4 sheets of 3 different surfaces. Each 12-sheet packet costs 3/-. From your Kodak Dealer.

Free "Bromesko" booklet from MR. A. P. TAYLOR, Dept. 57B,

● Here is the ALTIFLEX!

New Twin-Lens Reflex
Magnificent Value!

● Obtainable only from
the WESTMINSTER

READ THESE DETAILS:

A most attractive precision miniature reflex at only £5 12 6. Takes 12 pictures 2½ square on normal 8-exposure 120 film. Full-size finder with magnifier makes needle-sharp definition particularly easy. Delightfully smooth lever focussing, with scale down to 3 ft. Unique and positive film counter. All-metal body with fine leather covering. A fine camera for beginner and expert alike. Fitted with f/4.5 Vitar-anastigmat and Automat 4-speed shutter.

Price £5:12:6

12 monthly payments of 9/10.

Other models with f/3.5 lenses and Prontor and Compur shutters.

Write for full description.

Buy a LEICA at the WESTMINSTER

Model IIIa, shutter speeds 1 to 1/1,000th sec., T. and B., f/2 Summar, with side release (all chromium) £43:0:0
12 monthly payments of 75/3, 24 of 37/6.

As above, but with f/1.5 Xenon and quick-wind device (as shown) £63:0:6
12 monthly payments of 110/4, 24 of 55/2.

5-cm. Xenon Anastigmat only, coupled for Leica £34:0:0
12 monthly payments of 59/6, 24 of 29/9.

Quick-wind Device £3 14 6

ZEISS IKON IKONTA New 2½" sq. Models

Most recent addition to the Ikonta series, giving 12 pictures on usual 8-exposure 3½ x 2½ spool. 100 per cent self-erecting, and with shutter release on camera body.

F/4.5 Novar, in delayed-action Telma shutter, 1/25th to 1/1,250th sec., T. and B. £6:12:6
12 monthly payments of 11/7.

F/4.5 Novar, in delayed-action Klio shutter, 1 to 1/750th sec., T. and B. £7:5:0
12 monthly payments of 12/8.

F/3.5 Novar, in Compur shutter, 1 to 1/300th sec., T. and B. £9:10:0
12 monthly payments of 16/8.

F/3.5 Tessar, in Compur Rapid, 1 to 1/500th sec., T. and B. £13:0:0
12 monthly payments of 22/9, 24 of 11/5.

● COMPASS

With range-finder, exposure meter, light filters, panorama and stereoscopic attachments integrally built in. F/3.5 Kern anastigmat. Takes standard "miniature" pictures on plates or film in 6-exposure spools, both with daylight loading. Special roll film back and plate envelopes always available. Come and see it at the Westminster, or write for full description.

£30 Liberal exchanges. Balance by 12 or 24 payments.

● LATEST ROLLEIFLEX

In this new model the automatic 6 x 6 cm. ROLLEIFLEX, for 12 pictures on usual 3½ x 2½ spool, has been rendered even more fully automatic than before.

Only one action is now needed to (1) set the shutter; (2) safeguard against either blank or double exposures; (3) to give delayed action. There are also, amongst other improvements, new controls for shutter speeds and lens apertures with magnified readings. The reflex hood is fitted with larger magnifier, and there is a double magnifier and additional mirror for eye-level use. Lens is f/3.5 Tessar, with Compur Rapid shutter coupled to 1/500th sec.

Price: £31:5:0

12 monthly payments of 54/8; 24 of 27/4.

WESTEX Miniature

Lowest-priced, high-precision miniature. With famous f/2.9 Bionar lens, focussing to 3 ft. Prontor II D.A. shutter, 1 to 1/750th sec., T. and B. Strong, beautifully made, easy and delightful to handle, optical direct-vision finder. Takes 16 3 x 4 cm. on normal V.P. spool £5:12:6
12 monthly payments of 9/11.

With Vidanar 1/4.5 and Vario shutter to 1/1,000th sec.

VOIGTLANDER BRILLIANT NEW MODEL

A highly popular camera now offered in new de luxe form. Body moulded of special unbreakable material, comprising built-in hold-all for filters, supplementary lenses, etc. Takes 12 pictures 2½ square on normal 3½ x 2½ spool. Automatic film wind prevents all risk of overlapping. Lens, f/3.5 Voigtar in Compur Rapid shutter, 1 to 1/500th sec. A special "sports" direct-vision finder greatly facilitates rapid working.

"KODASCOPE" Model EE

With 300-watt lamp, this model is available with choice of six interchangeable lenses, giving projection 40×30 in. pictures from a distance of anything from 9 ft. upwards. Operation is quiet, flickerless, cool—and simple. Models supplied for either A.C. or A.C./D.C. circuits. With 1½-in. f/2 lens.

£32 : 10 : 0

24 monthly payments of 26/2.

NEW ROLLEIFLEX Model 1a.

Bigger value than ever. Shows your picture full size and right way up on the ground-glass screen. Takes 12 pictures on 3½×2½ roll film for 1/4. Body beautifully finished in art leather. With Compur shutter and Zeiss Triotar f/4.5 lens.

Cash price **£12 : 10 : 0**

24 monthly payments of 11/3.

PATHESCOPE 200-B

With 200-watt lighting. Pictures 10 ft wide easily obtainable. Flickerless projection, sprocket fed. Threading one side only. Single nut tilting device. Works off 110 volts. With lamp, plug, flex adapter and one empty 300-ft. super reel.

Cash price **£15 : 0 : 0**

24 monthly payments of 13/5.

NEW Voigtlander OPTICAL FINDER "BESSA"

The new optical finder springs into position, with its shield removed, directly the camera is erected, making it easy to select the best angle of view. It has automatic trigger release and changes automatically from 8 to 16 pictures, or vice versa, on 3½×2½ roll film. With f/3.5 Voigtar lens and Compur Rapid shutter, speeded to 1/400th sec., T. and B. £10 : 17 : 6

Cash price £10 : 17 : 6

ENSIGN MINIATURE MAGNAPRINT

Its tubular mounting is very rigid, free from vibration. For focussing the body slides freely on the supporting column, and clamps in the required position. Fine focussing is then carried out by the helicoidal lens mount which is provided with a large knob which locks it firmly in position at the required point. Takes half-V.P. Leica and Contax negatives. With f/6.3 lens.

Cash price £5 : 5 : 0

15 monthly payments of 7/5.

THESE FEATURES MAKE FOR SUCCESS

- Shoots sequence pictures with machine-gun speed.
- Lens always in "ready" position — no withdrawing necessary.
- Film winds itself automatically.
- Shutter sets itself automatically.
- Film counter operates automatically.
- No double or overlapping exposures possible.
- Automatic "Zone" focussing gives needle-sharp definition and supersedes range-finders.
- Takes up to 50 exposures on Standard 35-mm. film.
- Dual cassette loading permits removal of any part of film at any time for development.
- Camera opens in daylight for changing from "pan" to colour film at any moment.
- With motor wound takes from one up to 24 exposures in quick succession, or singly.
- Motor can be left permanently wound.
- Incorporates filter suitable for "pan" or "ortho" films.
- Exposure automatically compensated when using filter.
- Shutter gives "Time" and from 1 sec. to 1/500th sec. and all intermediate speeds.
- Weights 14 oz.—just heavy enough to be held comfortably without risk of movement.
- Overall size only 4½×2½×2 in.
- Three view-finders in one, including "right-angle" for "candid" work.
- Daylight-loading spools available.
- Camera has stainless steel body, covered black morocco.

"THE CAMERA THAT THINKS FOR YOU"

OVER 1,000 VAUXHALL MINICAMS SOLD!

We are certain that over half of these cameras have sold on recommendation and Press reports alone. We have not advertised extensively—as the prices would then have to be increased. We only ask you to compare the value we offer.

RANGE-FINDER VAUXHALL MINICAM

Here is a coupled range-finder miniature, fitted with the finest quality $f/2.9$ anastigmat lens in delayed-action Compur shutter, selling at a price which YOU can afford. Actually its nearest competitor is approximately 40 per cent higher priced—BUT the Vauxhall has numerous advantages not to be found in other cameras of this type. For instance, it takes two sizes of picture according to choice—either twelve $2\frac{1}{2}$ in. squares or $16 \frac{2}{3} \times 1\frac{1}{3}$ in. Another exclusive feature is the special radial focussing lever which automatically springs back into the infinity position when the camera is closed, thus preventing any possible damage to the camera or focussing mechanism.

PRICE £11 15s. ONLY

Yours for 20/7 down and eleven similar monthly payments.

The SPECTO PROJECTOR

NEW IMPROVED BLACK MODEL

3.5 AMP.

The 9.5 projector giving maximum screen illumination at minimum cost. Now in black finish.

£13 5 0

YOURS FOR 23/2 DOWN and 11 Similar Monthly Payments.

AUGUST PRESS REVIEWS ON THE NEW RANGE-FINDER MINICAM

"... We comment favourably upon a number of good points in the instrument, not the least attractive being the remarkably low price. The whole job is very well made, and our tests confirm the good opinion we formed of it upon inspection. The range-finder was photographically tested at full aperture on close-ups, medium distance and long shots, all of which proved to be dead sharp on enlarging. The lens is of excellent quality, the price is only £11 15s. complete so that the many advantages of a coupled-range-finder camera are now available to a much wider public than hitherto."

"... One important feature is the fact that immediately the side-struts are pressed to close the camera, the focussing lever, wherever it may be set, automatically returns to the infinity position, thus preventing any possible damage to the focussing mechanism. The Vauxhall Super-Minicam sells at £11 15s., which in consideration of its useful features and wide-aperture lens is exceptionally good value."

"... In spite of the comparatively large picture taken, the camera itself is by no means bulky. The Super-Minicam is sold at £11 15s., which is a very moderate price for a camera with its specification."

CRITICS' VIEWS on the New VAUXHALL DUAL-SIZED MINICAM

"... We gave this instrument a thorough test and found it operated excellently. The price is remarkably low, being £6 19s. 6d. only."

"... This new model is well and rigidly built and the price, £6 19s. 6d., is truly remarkable."

"... In appearance this camera is very attractive. The body being covered with morocco leather, and all bright parts plated. The Vauxhall camera is very good value for the price."

"... This newly introduced camera is decidedly neat and small for the size of picture it takes, and sells at a very reasonable price."

"... On test the camera performed well. The general construction is particularly rigid and is good value at £6 19s. 6d."

THE DITMAR DUAL PROJECTOR

Two machines for the price of one ! !

IMMEDIATE DELIVERY

SPECIFICATION. 500-WATT LAMP; Forward and reverse drive; $f/1.6$ Projection lens; Direct lighting; Still Pictures; Pilot Lights; Very Silent; 3 Models available: $9\frac{1}{2}$ -mm. and 16-mm.; 16-mm. and 8-mm.; 8-mm. and $9\frac{1}{2}$ -mm.

YOURS FOR 59/4 DOWN and 11 Similar Monthly Payments, or £33 18 0 cash.

STANDARD MINICAM

Constructed of Metal—NOT Bakelite.

AMAZING VALUE !!

Everybody, including the Press critics who have seen and tested the new all-metal Vauxhall Minicam, are amazed at the value. This low price is only possible because of the fact that we, as sole distributors, import large numbers direct from the factory in Germany, and, in addition, we are content to sell at a small profit. If you purchase a Vauxhall Minicam you will be saving approximately 50 per cent against the price of its nearest competitor.

PRICES :	
With $f/2.9$ anastigmat, micrometer focusing mount, D.A. Compur shutter.....	£6:19:6

THE new Compass Roll-Film Back can be interchanged with the standard hinged back (for glass plates) in a second or two. It holds its own miniature roll-film of 6 exposures—a most convenient number. It has positive one-turn-per-picture winding and a retracting pressure plate. The thickness of the camera is increased only $\frac{1}{4}$ inch. Two types of film are available, Selochrome at $1/6$ for two six-exposure spools and Selo Fine Grain Panchromatic at $1/9$ for two six-exposure spools.

Compass Roll-Film Back £5 · 0 · 0

● WRITE for the 48pp. illustrated Compass booklet. Appointed Compass Dealers will gladly demonstrate the Compass Camera and the new Roll-Film Back.

LONDON, W.C.1

Advantage is a better soldier than rashness

—HENRY V.

Marshal before you,—now the season's here
When Exhibitions press on every hand ;
Those qualities of paper that full oft'
Have flattered negatives with glowing tones.
Such warmth that kindles in the judge's eye
Approval, earnest of awards to come.
Warm tones, that by direct development
Are printed on the paper of your choice.
Such brilliance throughout the tonal range
As when the wind hath swept the landscape clear,

Such speed as doth facilitate the work
Of those who magnify their picture's field,
And spread a canvas, worthy to be hung
Beside the masterpieces of the art.
These forces, mobilized in Mezzotone—
Have long been hailed advantageous by those
Whose quest is quality ; in simple phrase
'For critical photographers,' And now
That Mezzotone at bromide price is sold
The user's purse enjoys advantage too.

KINE-EXAKTA—

with ZEISS TESSAR ANASTIGMAT f/3.5

The Zeiss Tessar f/3.5 is one of the finest lenses ever produced in this world-famous optical factory. The fact that they have been practically unobtainable for months is proof of their popularity for high-class miniature photography.

The great rapidity of the f/3.5 Zeiss Tessars, combined with the fine qualities of the less rapid high-class lenses, renders them pre-eminently adapted for taking pictures which demand extremely short exposures.

Price of Kine-Exakta with Zeiss Tessar f/3.5 is..... **£34 : 10 : 0**

Prices with other lenses on application.

MINIATURE REFLEX, for all makes Films, 24×36 mm., in cassettes or daylight-loading spools.

IDEAL FOR EXHIBITION ENLARGEMENTS

GEVALUXE VELOURS

GEVAERT LTD.
WALMER ROAD,
LONDON, W.10

The main reason for the unique qualities of prints on Gevaluxe is the unique surface consisting of thousands of tiny fibres. This surface gives the effect of real physical relief with wonderful blacks and rich luminous shadows combined with an extreme range of gradation.

Gevaluxe is as simple to use as ordinary Bromide and yields perfect enlargements and contact prints. It is equally suitable for landscape, portrait and interior subjects.

THE WELGARD Amateur Competition

Open to all amateur users of the
"Welgard" Print Exposure Meter

Prizes of £1 Is., 10/6 and 5/- will be offered for the best prints made with the help of a "Welgard" Meter. Closing date 1/11/37.

RULES

Amateurs only are eligible and the prints must be the work of the competitor throughout. The organisers reserve the right to reproduce any print submitted without fee, and each entry must be accompanied by the test exposure made with the "Welgard" Meter and bearing the name "Welgard," and also by the printed envelope in which the wedge was supplied. Contact prints or enlargements are eligible and the technical excellence of the prints will be primarily considered. Any subject may be chosen.

The decision of the Welgard Supply Company shall be final, and no correspondence can be entered into with reference to the Competition.

The WELGARD PRINT EXPOSURE METER is essential for determining the correct exposure when printing by contact or enlargement on all development papers.

Vol. LXXXIV. No. 2550.

IN this Autumn Number of *The Amateur Photographer* an extra amount of space has been devoted to the indoor work that will now occupy the attention of a great number of our readers. Under present conditions when so many amateurs are using miniature cameras, making enlargements in one form or another is the usually accepted method of print-making, and this receives the greatest amount of attention in the following pages. From our own experience and inspection of innumerable prints entered for competitions and exhibitions we are safe in saying that 90 per cent of the entries are made through the enlarger. For this reason we have included, in addition to several practical articles on the subject, a list of the popular size enlargers now available on the market; in an earlier issue we dealt with special enlargers for miniature cameras. Pressure on our space has unfortunately caused us to omit several regular features that would have otherwise appeared. This notably applies to two further reviews of the London Salon of Photography and the Royal Photographic Society's Exhibition, but our readers should note that these will be published in next week's issue.

Women as Professional Photographers.

The "monstrous regiment of women" (that's John Knox, not us) is invading professional photography with banners flying. Of the 174 exhibitors at the P.P.A. Exhibition at Princes Galleries, at least forty-six were women. We say "at least" because some of the others who disguised their Christian names under unsexed initials might have been

TOPICS of the Week

THE SPIRIT OF AUTUMN.

women too. We know some professional women who imagine that even in these days clients may be debarred by seeing a woman's name on a letter paper or a studio sign, and so use initials which might equally belong to a man, trusting

that when the client sees them face to face he will forgive the slight deception. The forty-six women exhibitors showed over 150 works between them, and their works were as varied in subject and as excellent in technique as those of their male colleagues. They did not confine themselves to portraits of their own sex. Indeed, why should they? Even the swish of female skirts is heard when royal portraits are being taken, and portraits of the King and Queen and other individual and grouped royalties were the work of women. Bless them!

You Cannot Go Wrong.

One of the marvellous things about modern photography is the virtual impossibility of going wrong. During a recent journey through the Sussex Downland we came upon a large number of people—hikers and others—using cameras, and the amazing thing was the little regard they paid to lighting, selection of subject, or anything else. A glance down the finder, a movement of the finger and they were ready for the next. Yet having had the opportunity of seeing some of the results of this casual midwifery one is bound to say that they were not the expected duds. Few of them would pass the test of a pictorialist critic, but they were quite bright and interesting little pictures, with nothing obviously wrong with them. Is photography becoming foolproof? Is there a divinity that shapes the ends of the snapshotter, rough-hew them how he will? Whatever you do with a modern camera and film it seems to turn out pretty well. Are our laborious instructions needless? Surely it will be a pity if a hobby grows so mechanically perfect that it calls for no skill or intelligence.

The Photographic Society Season Begins

A PERIOD of greater activity for photographic societies is now starting. While most societies and clubs in Great Britain (there are over 400 of them) have a summer programme, the fixtures are generally confined to outings and excursions to places of interest. A small proportion hold indoor meetings throughout the year, but it is only in the autumn that most societies really start their programmes.

Now, therefore, is the time for every amateur to become a member of the nearest club or society. The advantages are many, and the cost is generally small. For the novice in particular no better advice can be given than "Join a photographic society." They occur in nearly every part of the country, and in many of the big towns there are more than one.

Most of the British photographic societies not only welcome the beginner, but go out of their way specially to cater for his needs with practical demonstrations and helpful advice. A large proportion of them have their own premises or rooms, and are equipped with dark-rooms and workrooms in addition to meeting-rooms for lectures, etc. Frequent competitions and exhibitions of members' work are also held, with "criticism evenings."

The more advanced members of these societies include many of the leaders in photography in this country, and they are always pleased to help the beginners and less advanced members.

The new member who is still a novice will therefore gain far more than the subscription (generally quite nominal) indicates, and great

numbers of workers whose pictures regularly appear in competitions and exhibitions admit their indebtedness to the societies they joined soon after they took up photography.

The "winter season" is now starting, and attractive fixtures lists of lectures and demonstrations are being arranged. The novice who attends these will pick up a mass of useful information and practical instruction from association with other more expert members, and we will refer, in a later issue, to some further advantages of joining a photographic society.

In the meantime, if any reader who is not already a member of a society and is desirous of joining one, will write to us we will give him the address of the nearest society in his locality.

PHOTOGRAPHY CLASSES

At this time of the year evening classes in photography for amateurs are being started in all parts of the London area, in addition to those available at the Polytechnics. In every case all further information and a prospectus can be obtained on application to the Heads of the Institutes. The duration of the session is from the end of September to the end of the following June. We are indebted to Mr. C. L. Curtis, of Sydenham, for the compilation of the list that follows:—

LITERARY EVENING INSTITUTES (men and women over 18 years of age).

City, The Guildhouse, 12, Guildhouse Street, S.W.1. (Photographic, Science and Art.)—Mondays, 7.30–9.30; Thursdays, 7.30–9.30; Fridays, 6.30–8.30.
Dalston, County Secondary School, Colvestone Crescent, Dalston, E.8.—Tuesdays, 7.45–9.45.
Hammersmith, 50, Brook Green, Hammersmith, W.6.—Thursdays, 7.30–9.30.
Highbury, Highbury County School, Highbury Grove, N.5.—7.45–9.45 (evening not yet fixed).
Holloway, Holloway School, Hilldrop Road, N.7.—Tuesdays, 7.30–9.30.
Lewisham, Sandhurst Road School, Catford, S.E.6.—Wednesdays, 7.30–9.30.
Putney, County Secondary School, West Hill, S.W.15.—Wednesdays, 7.45–9.45.
Goldsmith's College, New Cross, S.E.14. (Pictorial)—Mondays, 8–10. (Technique)—Thursdays, 7.30–9.30.

MEN'S EVENING INSTITUTES (students over 18 years of age).

Battersea, Latchmere Road, Lavender Hill, S.W.11.—Tuesdays, 8–10; Wednesdays, 8–10 (and at Waldron Road Branch, Wandsworth, S.W.18.—Wednesdays, 8–10).
Bermondsey, The Alma School, Southwark Park Road, S.E.16. Classes meet at Galleywall Road School, Rotherhithe New Road, S.E.16.—Tuesdays, 8–10; Thursdays, 8–10.
Bethnal Green, 229, Bethnal Green Road, E.2.—Wednesdays, 8–10; Fridays, 8–10.
Deptford, Clyde Street School, S.E.8.—Fridays, 8–10.
Downham, Durham Hill School, Downham Estate, Bromley, Kent.—Tuesdays, 8–10 (and at Elfrida Branch, Bellingham Estate, S.E.6.—Thursdays, 8–10).
Kentish Town, Holmes Road, Kentish Town Road, N.W.5.—Thursdays, 8–10.
North Kensington, Bevington Road School, Portobello Road, W.10.—Thursdays, 8–10.
North Southwark, Orange Street School, Union Street, S.E.1.—Wednesdays, 8–10.

Poplar, The Hay Currie School, Byron Street, E.14.—Tuesdays, 8–10; Fridays, 8–10.

Stepney, The Raleigh School, Ocean Street, E.1.—Thursdays, 7.30–9.30.

Vicarage Road, Plumstead, S.E.18.—Mondays, 7.45–9.45 (and at Westhorne Branch, Nesbitt Road, Briset Road, S.E.9.—Thursdays, 7.45–9.45).

Walworth, John Ruskin School, Beresford Street, S.E.5.—Tuesdays, 8–10; Fridays, 8–10.

MEN'S INSTITUTES (JUNIOR) (students under 18 years of age).

Robert Browning, King and Queen Street, S.E.17.—Thursdays, 7.45–9.45 (and at Vauxhall Street School, Upper Kennington Lane, S.E.11.—Tuesdays, 7.45–9.45).
Shillington Street, Falcon Road, S.W.11.—A class meets at Heathbrook School, Wandsworth Road, S.W.8.—Tuesdays, 7.30–9.30; classes meet at Eltringham Street Branch, York Road, S.W.18.—Wednesdays and Thursdays, 7.45–9.45.
Stewart Headlam, Portman Place School, Globe Road, E.2.—Thursdays, 8–10 (and at Jews' Free School, Bell Lane, E.1.—Wednesdays, 8–10).
Upper North Street, East India Dock Road, E.14.—Mondays, 7.45–9.45.

OTHER INFORMATION.

Instruction will commence in the week beginning 27th September, 1937.

Fees for students living in the Administrative County of London:—

Literary Institutes (except Goldsmiths' College), one class per session, 7s. 6d.; each additional class, 4s. 6d. Admission to all classes for the session, 15s. od.

Goldsmiths' College, one class per session, 10s. od.; any number of classes, £1.

Men's Institutes, any classes, per term, 1s. 3d. (there are three terms in the session).

Men's Institutes (Junior), any classes 1s. od. per session.

Students living outside the Administrative County of London may, in many cases, be admitted at the ordinary London fee. Particulars may be obtained from the Head of Institute.

AUTUMN SUBJECTS FOR THE CAMERA

Autumn is the season when the indoor worker finds many new activities to attract him, and elsewhere in this issue the making of prints and enlargements is dealt with. There are, however, still many phases of outdoor work for the keen amateur and the following article indicates what they are.

HOW quickly the year has gone! The autumn is upon us before we are really ready for it. There are still many subjects we wish to take before the darker evenings come on. But what's the use, here we are at the fall of another year, and the thing to do is to cast aside those summer subjects which were in our minds and look at the autumn with our photographic eyes in order to make the most of it before that is gone too.

Gradual Changes.

One of the snags about the approach of autumn is that the actinic value of the light has changed so gradually and, unless we have been watching our meters very closely, imperceptibly. Yellow and orange tinges our light, particularly in the early evenings, and we shall be caught with a number of disappointing under-exposures if we don't look out. So the first precaution at the beginning of autumn is—watch your meter!

Shorter Evenings.

The amateur is also going to find his time for daylight work very much more restricted, particularly if he does not leave his place of business until round about six o'clock, and although the early morning may give him some useful subjects, his time is likely to be very much restricted if he is as dilatory in his rising as most folks are.

There is, however, one phase of this closing-in of the days in that many buildings which are positively ugly may make quite good subjects "between the lights," when the lights from their many windows give them quite a fairylike effect. With a small amount of daylight it is possible to give an adequate exposure in order to register the outside of the building, while the lighted windows make little splashes of light which register very well on a well-glazed print.

Moods.

Autumn is a season of moods, and there is a sufficient variety of these

to keep the amateur photographer very busy during the short season. Who has not been impressed with the autumn day when with a good stiff breeze the leaves come swirling down on the passers-by, who hurry along with their hands on their hats? A splendid subject for a photograph, albeit a difficult one if he is aiming to get that feeling of swirling windy atmosphere in the print. The light is still good enough about midday to give quite a short exposure with a fair-sized lens, and if there is a slight blurring of the leaves it is not detrimental to the effect so long as it is not overdone.

Or the early morning mist, with the yellow sunlight endeavouring to break through—early morning, but not so early that one has to rise at an unearthly hour. Here is a reasonably difficult subject if one is to render the mist nicely so that it does not look as though one let unwanted light get to the negative. No filter is required, and an orthochromatic film or plate is likely to give a better rendering than a panchromatic. A foreground object is almost essential in order to show up the mist, while an attempt should be made to get some more shadowy shape well back into the picture in order to represent the deepening distance.

Colours.

Without doubt, the most delightful part about the autumn landscape is the amazing array of colours, and all colours that are particularly amenable to registering in monochrome. The brown earth, the stubble field, the gold, red, yellow, dark green, the yellow in the sky, all combine to make a subject at once difficult and beautiful. Panchromatic material is really essential, although ultra-fast material is not necessary, the fact of grain being more prevalent in this latter making it best left for subjects needing the last ounce of speed.

Various filters can be made the subject of experiment, but a four-times with the aid of a medium-speed pan. will give an excellent rendering with correct exposure.

Exposure.

This question of exposure is more than usually important when endeavouring to record these various degrees of colour, because it must be remembered that they will be represented on the negative in varying grades of density right from almost clear film to impenetrable black, and a little exaggeration or restriction will spoil the whole range and destroy the effect aimed at. Use a meter you know well, and material with which you are very familiar, and multiply your exposure according to your filter experiments, and stick to that factor.

Frosts.

Early autumn does not produce many frosts as a rule, but sometimes the sudden change from warmer weather to fairly cold produces a hoar-frost effect on bushes and trees, and this should be recorded if suitable subjects can be found, since it is all part of the mood of the English autumn.

Cobwebs are very usefully employed in this respect, a web strung across in the open being found, and the sparkling drops on each slender thread being registered against a background thrown out of focus. A long-focus lens does this better than the rather short focus of the miniature, although it can be managed with the latter.

Flowers.

The autumn brings in the chrysanthemum, a flower which photographs extremely well. Outdoor studies of a few blooms can be very well managed, but on the whole it is better to take a few flowers and put them into a nice formation, in a vase or pot. Here colour again plays an important part, and the novice might well try a few experiments to see if he can register, say, an orange, a lemon, a bronze and a red chrysanthemum in their correct monochrome shade. Panchromatic material and a filter will, of course, be necessary, and a series of exposures made with different filters will give a set of most instructive results.

September 22nd, 1937

AUTUMN

By LESLIE SANSOM.

STORMY EVENING. Exposure $1/25$ th sec., $f/11$. Pan. film.

IN spite of the trend towards the bizarre in photography, a plain sunset picture is still one of the most attractive of photographic subjects.

Such a wealth of natural beauty is present in a sunset, that by merely pointing the camera and "pressing the button" one is sure of a striking result, though the general composition may not make it an exhibition picture.

Indeed, except for the arrangement of foreground detail, there is little that the photographer can do to improve upon a scene that may well be described as Dame Nature's most gorgeous effect.

New angles, worm's-eye views and the like are unnecessary to add variety to a sunset picture, for the subject itself is one of ever-changing colour and form. Every sundown the lighting and cloud formations present a different aspect, an endless variety of photographic subjects, something at which man can wonder, but never imitate.

Even those "special effect" men in the Hollywood studios—wondermen who make raging storms, sunlit beaches and London fogs to order—cannot make a good sunset. They look too much like soft lights and cotton-wool.

Autumn is one of the best seasons to be on the look-out for sunsets, for it is then that the bold cloud formations are to be found. The best type of sunset from a photographic viewpoint is when there are huge masses

of well-defined clouds in the sky.

If the day is rather windy, the clouds will be kept moving to produce constantly changing effects. The exposure should be made when the sun is just about to break out from behind the clouds, forming an edge of brilliant silver, just like the silver lining we are told every cloud possesses.

The instruction book advice, "never point the camera directly at the sun," must be forgotten, for the sun will naturally form the centre of interest in most of these pictures.

Point the camera directly at the sun by all means, but be careful not to make the exposure until the direct rays of the sun are shielded from the lens. In other words, wait until the sun goes behind a cloud. Not a big one, for the good effect will then be lost, but one of those small clouds that drift in front of the sun to obscure it for a few seconds only. Your shutter must be released during those few seconds, to capture for all time a fleeting mood of Nature that will never recur.

The light will mostly be red and yellow, so the best results in black and white will be those taken on panchromatic material. If the clouds are well defined, quite good results can be made on ordinary film, but it is best, generally speaking, to use panchromatic plates or films.

The addition of a light yellow filter, one that increases the exposure two times, will be a further help, a deeper

THE PALACE PIER, BRIGHTON. Even a seaside promenade can be transformed into a thing of beauty by the setting sun. Exposure $1/25$ th sec., $f/11$. Pan. plate.

N SUNSETS

filter rarely being needed. A graduated sky filter is the type that will be found most useful.

Owing to the brightness of the sky at sunset time, it generally happens that the sky is well exposed, while the landscape portion of the negative is a mere shadow. The graduated filter will do much to even up matters in this

SUNSET OVER THE IRISH SEA. A picture from the coast of Lancashire. Exposure $1/25$ th sec., $f/11$. Graduated yellow filter.

respect, and can be used on all pictures that have a fairly even skyline.

Owing to this brightness of the sky, it will be found that seascapes form the best sunset subjects, for the sea reflects much of the brilliance of the sky, thereby levelling things up much better than when the light is absorbed in the deep shadows of the average landscape picture.

Do not, however, photograph straight out to sea, with an unbroken horizon stretching across the picture. A boat, some jagged rocks or a group of figures in the foreground, will give the picture a much better finish. As the sun is low in the sky, some very novel shots can be obtained by taking

SUNSET SHADOWS. $1/50$ th sec., $f/8$. Ordinary film.

the elongated shadows of people on the sands. Action pictures of horse riders or athletes, silhouetted against the evening sky, also look very good.

As you are photographing directly into a bright sky, it will be essential to use a lens hood, as with seascapes, when the sun is low, there is almost as much light reflected from the sea as there is in the sky.

Readers' Hints, Tips and Gadgets

ENLARGING IN COMFORT.

THERE are many occasions when the mere thought of going into a cold dark-room (in my case the kitchenette) is quite sufficient to keep me away from it. This room has a stone floor, and although I take the precaution to see that my solutions are kept at a good working level the general atmosphere of the room on many a winter evening (and I can only work during the darker months) is rather chilly. As I feel sure that there must be many amateurs similarly placed, I have made an enlarging easel which enables me to work in comfort in a warm room. This easel is clamped to the end of the dining-room table (when fully extended it measures 6 ft. 6 in.) and gives me plenty of length for most of my work. My enlarger is placed at the other end of the table and a two-way adapter plugged into the top-light provides me with the necessary lighting for enlarger and orange safelight. The drawing shows the easel clamped to the end of the table-top. I have also cut a piece out of the centre of the easel and put in a focussing screen. This was made from an old quarter-plate negative (by rubbing two old quarter-plate negatives together with bath-brick powder and water). This focussing screen was not possible when I worked in the kitchenette as my easel was then held in position by the simple means of jamming it against the wall with the end of a table. Now I have room to get behind my easel and see my focussed image on the ground glass. By the way, this screen must only be sunk into the easel *its own thickness*, otherwise the screen and bromide paper will not be in register.

The making of the easel is quite within the reach of the average handyman, and its cost need be very little.

The main board is made with a piece of $\frac{1}{2}$ -in. or $\frac{3}{8}$ -in. thick plywood (an old drawing-board is excellent for the purpose) 18 x 18 in. A base the length of the board, $3\frac{1}{2}$ in. broad by $\frac{3}{4}$ in. thick is glued and screwed to the bottom edge of the board. Care must be taken to see that this piece is fitted exactly at right-angles to the board. Two brackets, also $\frac{3}{4}$ -in. thick, are made about 7 in. long and shaped as in drawing. These must also be planed up dead square. They are then glued and screwed in position about $1\frac{1}{2}$ in. from each end. This allows room for the two cramps. These cramps can be bought for a few coppers from any ironmonger's store. It is advisable to glue a strip of felt on the bottom if the table used is a polished one, and two scrap pieces of wood $\frac{1}{2}$ in. thick should be used under each cramp to save the underside of the table-top.

As to developing, I do this on a baker's board (many bakers are glad to get rid of them) which sits on the table on a piece of felt or similar material. This board is large enough to hold three

10 x 8 in. dishes comfortably, and if a few old newspapers are first of all placed on the bottom any spilling which might occur is of no consequence. Since making this easel I can now work in comfort in a nice cosy room with a fire in it. Any light from this source can be rendered harmless by placing a chair in front of the fire with an old coat flung over the back of it. I can honestly say that I am now turning out better prints than

before, and it is largely due to the added comfort which I now enjoy.

The sizes I have suggested can be modified to suit the requirements of the individual.

In closing, I might add that the use of this room usually costs me the price of the "pictures," but it's well worth it. DAVID HODGKINSON.

DRYING-LINES for ENLARGEMENTS, PRINTS OR FILMS.

A BENT pin on a string is to most people but a far-off memory of a boyhood's primitive hunting weapon. Revived in the manner shown here it forms an obviously convenient implement for hanging up enlargements, prints or films to dry. They are just hooked on by one edge, or, if small, by one corner. If the enlargements are above 10 x 8 in size, the familiar spring-peg of the household can be used for the same purpose. They are particularly useful for big, heavy prints. Use one to grip each of the extreme corners of the top edge of the print, which will then dry comparatively flat.

It has the disadvantage that the line on which pegs are strung is liable to sag, especially when the weather changes from damp to warm and dry. The pegs are then very liable to run together gradually into the bottom of the dip in the line,

To avoid this have a coiled wire spring at one end of the line. It will keep the latter always taut. An alternative method is to use the small wire

paper-clips found in every office. A few of these clipped on to the line here and there will act as stops and prevent the pegs sliding along and allowing the prints to touch. D. C.

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

Picture-Making by Enlarging

By EMSLIE DEAN.

No. 1. Cornish Fishermen.

THE necessity for enlarging practically every negative taken with a miniature camera has not only introduced the technique of making an enlargement to thousands of new amateurs, but has drawn their attention to the possibilities of the enlarger for picture selecting.

The beginner, however, is never fully aware of the real utility of this, and his tendency, with that of many more advanced workers, is to enlarge the whole of the negative, or, if he realises that a part is sometimes greater than the whole (pictorially speaking), is never drastic or adventurous enough to explore all the possibilities of the small original to see how many pictures it contains.

Even if he is satisfied that the complete negative does make a good

composition without cutting, there are few snapshots of open-air subjects that will not bear trimming and further enlarging to produce several more good compositions. Anyway, it is always worth trying, and it is good fun.

In cases where too much material has been included, and these are in the majority with most amateur miniature shots, the matter adjusts itself by demanding attention.

The print reproduced herewith, showing the complete negative, is a typical instance. A good snap of a quayside subject—unloading the catch of pilchards. The figure on the right was, needless to say, not observed at the time, and the print in its entirety obviously includes too much.

Print from the whole negative.

No. 2. A Study of Boats.

For the worker who has not attempted this form of selection the procedure is as follows. First make a good enlargement, say whole-plate or larger, of the complete negative.

When dry proceed to mask out different parts of the subject to find attractive bits or groups that can be enlarged separately as complete pictures. The easiest way to do this is to employ the old dodge of two L-shaped pieces of

No. 3. Contemplation.

thin card, the legs of which are at least as long as the width of the print. One is crossed over the other to form a right-angled frame, the opening of which can be altered to any size or shape by sliding the pieces about.

Placed on the print and moved all over its surface various sections

No. 4. A variation of No. 1.

of the subject are masked from their surroundings. It becomes a fascinating game to see how many different "bits" are disclosed that can be regarded as pictorial compositions.

On this page and overleaf are reproduced five out of a dozen made from the subject in the middle, and as the negative was sharp in detail still further enlargements could have been possible even to comparatively large portrait heads of the two fishermen.

The worker with a miniature fitted with a good lens that gives really sharp negatives is for ever surprised at the amount of detail that progressively discloses itself. A moderate enlargement excites interest in the additional details that appear. A still greater enlargement arouses amazement if it is carried to the limit of the "grainless" stage.

When the "bits" have finally been selected the enlarger is brought into use and that particular rectangle focussed up to the desired size. It is then—if the negative is a good one—that the beauties of the detail secured will be disclosed, and this is one of the minor delights of miniature photography. The worker with the big camera knows what his

No. 5. Unloading the catch.

negative will give him. The miniature worker is ever in a state of anticipation and is never quite sure until the enlargement is taken out of the fixing bath what the enlarger has done for him.

Apart from the selection of particular figures, groups and other bits from a complete shot, the trimming of these portions affords a further exercise for the picture-seeker. He will be surprised how many alternative shapes may be

employed with the same central figure and yet each produce an attractive composition. An example of this is given in Nos. 1 and 4 on the preceding page. Many other variations for trimming this particular bit were also possible.

When the worker becomes more expert and observant he will find that it is not always necessary to make a print and mask it in the manner described. Provided the negative is not too large and the masking arrangements on the easel of the vertical enlarger are readily adjusted, the choice of subject can be done with the projected negative image only. This will add a still further fascination to making enlargements from miniature negatives, and particularly applies to the 35-mm. strip,

which can be run through the enlarger until a likely subject appears on the easel. It can then have the various maskings adjusted in conjunction with different degrees of enlargement. What at first may appear as an insignificant bit will, on greater enlargement, assume the proportions of an important picture.

In this way many of the negatives taken during the summer may yield more than one picture apiece.

Clipping the Paper on the Enlarging Easel

1. White paper mounted on a card makes composing the picture easy.

WHILST many people like the white margins to their enlargements which the commercial composing-frame produces, others prefer to use the maximum area of their bromide paper, afterwards trimming off only the barest edges. In order to achieve this satisfactorily it is necessary to have some means of registering the bromide paper accurately with the desired part of the image, and then of securing it in place. Here are two very simple methods of doing this.

The first one comprises having a piece of white paper the same size as the bromide paper to be used, stuck

flatly on a larger piece of thin card. One of these can be made in a few minutes for each stock size used. The picture is composed on the white area, which can be moved about as required to get slanting horizons level, and so on. Then the light is switched off and the sensitive paper can be laid with perfect confidence just to cover the white focussing space, and can be held in place by means of four pennies. A penny at each corner will weight the paper satisfactorily while

2. Pennies weigh down the extreme corners of the bromide paper.

3. Two rulers and a yard of elastic make an adjustable paper-grip.

obscuring only the minutest edge of it.

The second method is to buy a yard of half-inch wide elastic and two rulers. The elastic is cut in halves and is stretched across the easel, where it can be fixed with drawing-pins. It then forms a pair of springs which hold the rulers quite firmly while allowing them to be freely slid about or lifted as desired. In using this method it is not necessary to mount the focussing sheet at all. When the view has been satisfactorily arranged on its surface, it is just clipped by the rulers, as shown in illustration 3, and the bromide paper is then laid on it and is held in the same way. S. K.

Modern Miniature Cameras

THE FOTH-FLEX.

THE Foth-Flex belongs to the very popular class of twin-lens reflex cameras making 12 exposures, each 6×6 cm., on an ordinary 8-exposure $2\frac{1}{2} \times 3\frac{1}{4}$ film. For those who prefer fewer exposures on the spool, it is so designed that it can equally well be used with a $2\frac{1}{2} \times 2\frac{1}{4}$ film, giving 6 exposures only.

Focal-plane Shutter.

Unlike the majority of cameras of this class the Foth-Flex uses a focal-plane shutter in place of the more usual between-lens shutter. The range of snapshot speeds provided runs from $1/25$ th to $1/500$ th second, and there is also a bulb setting in conjunction with which an automatic slow-speed device gives exposures from 2 seconds to $1/10$ th second. In addition, a delayed-action device is incorporated, the clockwork for this being independent of that used for the slow speeds, so that it is possible to use the delayed action and the slow speeds together.

The speeds of the shutter can be altered either before or after winding, but it should be noted that they only indicate correctly before winding. The shutter release takes the form of a lever on the side of the camera. This is conveniently placed for the thumb, but care has to be taken that the palm of the hand does not come into contact with the speed dial, which rotates when the shutter is fired. Provision is also made for fitting a wire release.

The lenses fitted are Foth anastigmats of focal length 75 mm. and aperture $f/3.5$. Focussing is controlled by a lever on the right-hand side of the camera front. This lever, which carries a dial graduated in distances from infinity to 5 feet, sends the lenses forward in synchronised focussing mounts.

Self-erecting Hood.

The hood over the focussing screen is of the usual four-fold design and is made of metal. When the cover is lifted the remaining three sides spring automatically into position. Inside the back flap of the hood there is a magnifier, which in its normal position is folded down, but a touch on a button causes it to spring up ready for use. The image is bright and easy to focus, and as the finder lens is permanently at its full aperture of $f/3.5$, it is quite easy to determine when sharpest definition is obtained, even in a poor light. A depth-of-focus table is affixed to the outside of the hood, by the aid of which, in conjunction with the focussing scale, it becomes easy to determine the range of depth of focus at any aperture to which the iris of the taking lens is adjusted.

Automatic Counter.

The bottom and back of the camera hinge open independently for loading. The full spool is dropped into a film chamber at the bottom of the camera, and the pull-out pins upon which the spool revolves spring back into position to hold it. Before reaching the back of the camera the film passes over a roller which actuates the automatic counter. It is threaded on to the take-up spool in the ordinary way, the back of the camera is closed, and the film wound on until the first number appears in the red window. Two of these are provided, one for a 12-exposure and one for a 6-exposure film, and both have screw-on covers to provide complete protection against fog. After releasing the counter and allowing it to run back to "1" the film advance is controlled by winding after each exposure until the next number in order appears in the counter-window. When the film is taken out, the counter runs automatically back to "1."

In use, we found the camera convenient to handle, and observed that the shutter release was light and that the shutter worked very smoothly and showed no tendency to jar the camera when released. It is quite small and convenient to carry, its dimensions being $5\frac{1}{2} \times 3\frac{3}{4} \times 3\frac{1}{2}$ inches over all projections, and its weight 38 oz.

The Foth-Flex fitted with $f/3.5$ lenses is priced at £10 7s. 6d., complete with neck-strap and wire release. It is also available with a pair of matched Foth anastigmats working at $f/2.5$, the price then being £13 10s. It is this model, which has slightly different focussing arrangements, that is illustrated. The Foth-Flex is obtainable from all dealers, and any further particulars of it which may be required can be had from the sole agents, Messrs. Peeling and Van Neck, Ltd., of 4-6, Holborn Circus, London, E.C.1.

CABARET.
From the London Salon of Photography.

Miniature Camera Gossip

By LANCELOT VINING.

IN my gossip of 2nd June, I mentioned that I had photographed the Readinger Twins in the Mayfair Hotel Cabaret, and that feeling sure I could do better, I had paid a second visit. Although at the time of writing I had not printed the results, I said I thought I had secured a picture suitable for exhibition purposes.

I will continue the story: I had certainly done better on my second attempt, but still had not got the result I had in mind. So a third visit was made to the Twins, and to-day I was able to see the result hung at the Salon. I wonder how many people will stand in front of it and say, "Lucky shot!"

I also have two at the "Royal," but have not been able to visit them yet, and shall not have a chance until I return from the West in a week's time.

Under their Wing.

Following my paragraph of September 8th, Messrs. Sands Hunter wrote to me on the subject of the "Kalart" Speed Flash-gun. One is being sent to them for trial, and if they are taken with it they may decide to act as agents for it in this country. They say that at all events they have heard very good reports of it from the States. If they do take up the agency it will save English buyers any amount of trouble to have it available over here. So I repeat, "Wait awhile."

Not as Expected.

This week I spent a day going to Hereford to photograph the first English hop-picking machine. I expected to find it going up and down the field between the lines of poles, but it proved

to work the other way round, as the hop strands are taken to the machine. This is a very large affair indeed, and is housed in a building which fits it on all sides.

I ought to have had my wide-angle lens, a tripod and a few Sasha lamps, but the miniature managed to make quite a good job of it under very difficult conditions. If any of my readers are interested in these pictures, they will find them reproduced shortly in one of the journals for farmers. It required a set of seven photographs to illustrate this very interesting invention, which may eventually displace human "hop-pickers."

Congratulations

To Messrs. Ilford for publishing the Scheiner speeds of their films for the sake of miniature users with meters; perhaps this will help to bring one or two other firms into line. And I do wish all manufacturers of fine-grain developers would publish time and temperature tables. If they did, I am sure miniature-camera enthusiasts would show a much greater readiness than they do to try new developers, but when no exact and detailed information is given the risk of wrongly developing, and possibly even spoiling, a strip of 36 exposures is a decided deterrent to experimenting.

Will readers please note that I have never made a claim to being an authority on D76. Four of my letters this week have been about this developer, but I think all queries on this subject should be sent direct to Messrs. Kodak. I am sure they would be pleased to deal with them, and I am quite certain they know a lot more about it than I do.

TEN GUINEAS AND UNDER

A Section for the User of the Inexpensive Miniature.

A Dual-Purpose Enlarger By A. H. GALE.

The arrow indicates the sign that forms the subject of the two larger illustrations.

IT is probable that I am by no means the only photographer who, though reluctant to part with his larger camera, uses a miniature as an auxiliary for the sake of its portability. Photographers who do this find themselves in possession of negatives of two sizes—usually $3\frac{1}{2} \times 2\frac{1}{2}$ and either 3×4 cm. or 24×36 mm.—from which they wish

shop-soiled but in practically new condition (list price, £7 5s. 6d.).

I recently purchased a Leica with f/3.5 Elmar, and asked the makers of my enlarger whether they could adapt it so as to make it more versatile. They have altered the body so as to give a minimum lens-to-negative distance of about 2 in., and supplied detachable lens panels for the Dallmeyer and Leica lenses. All this cost about 25s., so that the total cost of the enlarger, including Dallmeyer lens, has been something under £6. I have mounted the enlarger on permanent rails fixed to the dark-room wall, which allows of a distance of about 4 ft. negative carrier to bromide paper.

The illustrations show: (a) A contact print from a Leica negative; (b) an enlargement of the notice on the right made with the Dallmeyer lens at the maximum position; (c) an enlargement of the same notice made with Leica lens also in the maximum position.

I realise that I have not got the refinements provided on the beautiful precision enlargers made specially for miniature work, but

I could hardly expect them for the price I have paid. Any failures I get are due to my own shortcomings, and cannot be laid to the door of the enlarger, which, in spite of its comparatively simple construction, will do all I am ever likely to require.

to make enlargements. The difficulty then arises, at least with a vertical enlarger, that a lens of long enough focal length to cover a $3\frac{1}{2} \times 2\frac{1}{2}$ negative will give no prints larger than perhaps half-plate from the miniature negatives, and demands that the whole negative be used to give a print of even this moderate size. From a portion of the negative it may be that nothing more imposing than a $3\frac{1}{2} \times 2\frac{1}{2}$ print can be obtained.

Enlargers with interchangeable lenses are normally expensive, and the user of a camera costing under ten guineas will hardly care to spend double that sum on his enlarger. Since my own enlarger, though available to anyone, does not figure in any catalogue, a description of it may be of interest.

It is a No. 2 Amplus, fitted with a 4-in. f/4.5 Dallmeyer enlarging lens. It has a masking carrier for $3\frac{1}{2} \times 2\frac{1}{2}$ negatives and cost me about £4 10s.,

Enlargement to 21 diameters of part of Leica negative. (Leica lens.) (Whole negative to 30×20 in.)

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

D76 DEVELOPER.

Can you give me the formula for D76 developer, and tell me also the correct dilution and development time for tank use? N. H. P. (London.)

The following is the formula for D76:—

Metal	17½ grs.
Sodium sulphite (anhydrous)	875 grs.
Hydroquinone	44 grs.
Borax	16 grs.

Having weighed out the above quantities the developer is made up as follows:—

The metal is dissolved in 4 oz. of water at 130 degrees, and, roughly, one quarter of the sulphite in a second 4 oz. of water at 160 degrees, and this second solution is added to the first.

The rest of the sulphite, the hydroquinone, and the borax, are dissolved in order in 8 oz. of water at 160 degrees, and this solution is added to the mixed metal-sulphite solution. The whole is then brought up to the final bulk of 20 oz. by the addition of cold water. This developer is used undiluted in the tank, but a tankful of developer (usually about 16 oz.) may be stored in a well-corked bottle after use and will develop, in all, about 4 spools of film.

At 65 degrees development times range from ten or twelve minutes for the fastest panchromatic films down to about five minutes for slower films. These times are not rigid, but may be altered to give you the kind of negatives that you like.

FITTING A TELEPHOTO.

Is there any means by which a telephoto lens can be used on a miniature camera fitted with a Compur shutter, not as a permanency, but interchangeable with the ordinary lens? A. O. C. (Okehampton.)

In general, a miniature camera fitted with a Compur shutter cannot be equipped with a telephoto lens, as it is necessary to remove the back component of the normal lens before fitting the telephoto. This can only be got at by opening the back of the camera and removing the film. Where the whole lens unscrews bodily, as in cameras with focal-plane shutters, and in one or two using shutters immediately behind the lens, the interchange is possible, as the shutter protects the film from light during the exchange.

POLISH OF LENS.

The front half of the lens of my miniature enlarger, recently acquired second-hand, presents a definitely veiled or misty appearance when viewed against the light. Cleaning the lens does not get rid of it. The back half is absolutely clear. What is wrong, please; will it matter, and if so can it be cured? H. W. (Derby.)

The information you give rather suggests that the original polish of the lens has been to some extent lost, possibly by careless cleaning. If the polish has gone to any appreciable extent the lens will tend to give flat and foggy enlargements, and the only remedy in that case is to have the lens repolished.

CONTINUOUS AGITATION.

I develop my miniature negatives in a tank, but when using fine-grain developers requiring half an hour or more I find it tedious to have to stand over the tank and agitate the film every minute or so. If I made a mechanical agitator would it be satisfactory, or is it a bad plan to have the film constantly on the move? C. G. (Thames Ditton.)

We do not see any objection to keeping the film constantly on the move as long as there is not too much agitation, which would be likely to cause air bubbles. We would draw your attention to the fact that with continuous agitation the time required for development will be rather less than in a case where the film is only moved at intervals.

DEVELOPMENT TIME.

Please give me information as to time and temperature for developing Agfa Isopan F film (new series) in D76 developer in a tank. The negatives, of 24×36 mm. size, will be wanted for making quite big enlargements. H. P. (Merioneth.)

We should suggest a development time of about five minutes at 65 degrees when developing Agfa Isopan F, new type, with D76 developer. As, however, no two people seem to like the same kind of negative we do not suggest this as more than a starting point by which you can find by an experiment the precise time which gives you the type of negative which you prefer.

Ensign

MAGNAPRINT

Reduce imperfections
in your negatives to a
minimum without loss
of speed.

ENLARGERS

Reduce imperfections in your negatives to a minimum without loss of speed.

Ensign Magnaprint Enlargers give super-speed without loss of quality, due to the perfect system of illumination, whereby the light, diffused at its source and requiring no adjustment, is concentrated on the lens by a powerful double condenser. By this means, every ray of light coming from the illuminating source is used for the purpose of exposure. Grain, scratches and imperfections in the negative are reduced to a minimum and at the same time excessive contrast is controlled.

In fact, Ensign Magnaprint Enlargers are the perfect combination of light and speed.

Automatic Focussing Model with Friction Drive Raising Mechanism.

Automatically in focus for all sizes. The supporting column is fitted with an accurately machined camplate working in conjunction with the lens. The body is light and is moved easily up or down by a friction drive operated by a large white knob.

AV/II For $2\frac{1}{2} \times 3\frac{1}{2}$ in. (6×9 cm.) negatives and smaller. Enlarges $2\frac{1}{2} \times 3\frac{1}{2}$ in. negatives from $3\frac{1}{2} \times 4\frac{1}{2}$ in. to 15×12 in., other sizes in proportion. Fitted with DALLMEYER f/4.5 Anastigmat. . £13 10 0

Standard Models with Friction Drive Raising Mechanism.

The body is moved up or down on the standard by a friction drive operated by a large white knob. Focussing is carried out by rotating the helicoidal lens mount which is provided with a large knob which locks it firmly in position at the required point.

V/10	For $2\frac{1}{2} \times 2\frac{1}{2}$ in. (6×6 cm.) and smaller. Enlarges $2\frac{1}{2} \times 2\frac{1}{2}$ in. negatives from $3\frac{1}{2} \times 3\frac{1}{2}$ in. up to 15×12 in., other sizes in proportion.	£8 10 0
	Fitted with ENSAR f/6.3 Enlarging Anastigmat	£10 10 0
V/10M	Fitted with MAGNAR f/4.5 Enlarging Anastigmat	£10 10 0
V/11	For $2\frac{1}{2} \times 3\frac{1}{2}$ in. (6×9 cm.) and smaller. Enlarges $2\frac{1}{2} \times 3\frac{1}{2}$ in. negatives from $3\frac{1}{2} \times 4\frac{1}{2}$ in. up to 15×12 in., other sizes in proportion.	£9 10 0
	Fitted with ENSAR f/6.3 Enlarging Anastigmat	£11 10 0
V/11M	Fitted with MAGNAR f/4.5 Enlarging Anastigmat	£11 10 0

For complete range of Magnaprint Enlargers, including Miniature Models, write for Brochure, "On the Art of Enlarging," by Ensign.

BROMIDE STRIP CALCULATOR

An invaluable aid to enlarging, since it enables tests to be carried out under varying conditions which will give the operator an exact guide to the exposures necessary to produce best results. A test strip of bromide paper is inserted and exposures of varying duration given with the negative

ven with the negative in place, the slide being moved along between each exposure so that each section is uncovered for a different length of time. Metal throughout. Will not warp. Black crystalline finish.

AUTO-MASK PAPER HOLDER

Consists of a metal plate with a hinged cut-out top, which folds over the bromide paper, holds it in position and gives a clean-cut mask to the print. The centre of the paper holder is of white paper for focussing. Up to the half-plate size the front mask has springs for automatic raising. The 10x8 in. and 12x10 in. sizes have a finger lift for raising.

$2\frac{1}{2} \times 3\frac{1}{4}$..	12/6	$6\frac{1}{2} \times 4\frac{3}{4}$	17/6
$\frac{1}{4}$ -plate ..	12/6	$8\frac{1}{2} \times 6\frac{1}{2}$..	£1 2 6
$5\frac{1}{2} \times 3\frac{1}{2}$		10×8 ..	£1 7 6
(postcard) 12/6		12×10 ..	£1 12 6

ENSIGN, Limited, HIGH HOLBORN, LONDON, W.C.1

**IMPORTANT**

If you purchase a Zeiss Ikon Camera at current listed prices fitted with a Compur Shutter, or over £10 in value, ask your dealer for the Zeiss Ikon approved three years' guarantee. This guarantee only applies to cameras purchased in Great Britain and Ireland.

***Do you know what this is?***

The illustration shows the extremely convenient position on the top of the camera of the controls on the new model Ikonta for 12 2¼" × 2¼" pictures on the usual 3½" × 2¼" spool.

At the top of the picture is shown the film winding lever. Next comes the opening button. A pressure on this button and the camera springs into position for taking pictures while the direct-vision optical view-finder, which is shown next, springs open simultaneously.

Near the bottom of the picture is the shutter release button, which not only facilitates taking pictures from eye-level but enables the camera to be held more steadily when making exposures. The other controls for the lens focussing, diaphragm and shutter speeds are naturally either on the lens mount or shutter itself.

IKONTA NEW MODEL**FOR 2¼" × 2¼" PICTURES**

With Novar f/4.5 and Telma shutter	£6 12 1/2
With Novar f/4.5 and Klio 00 shutter	£7 5 0
With Novar f/3.5 and Compur 00 shutter	£9 10 0
With Tessar f/3.5 and Compur 00R shutter	£13 0 0

Write for full particulars of the Ikonta, or ask your dealer for a demonstration.

ZEISS IKON LTD., 11, Maidstone House, Berners Street, London, W.1

What EXPOSURE for the Enlargement?

By DAVID CHARLES.

THE puzzlement about exposures which assails everyone when taking up enlarging for the first time is no "inferiority complex." In actual fact the oldest hand is almost as much at sea when he buys a new and different enlarger, or even when he opens a packet of bromide paper of a make he has not previously used.

It is not the slightest use to place a sheet of bromide paper on the enlarging easel, to make a "guess" exposure, and to hope that a satisfactory print will emerge. With the greatest care in exposing and developing negatives they vary in contrast and in density owing to the nature of the subjects and the conditions under which they were taken. These differences give rise to the need for corresponding compensations in the exposure which will produce the most satisfactory print.

The simplest way to discover the proper exposure is by means of a test-strip or "trial." At the start it is possible that a number of such test-strips will be made, because in a sense they themselves depend partly on guesswork, and

Fig. 2. Test-strips for Fig. 1.

Fig. 1. The Print for testing.

the first "guesses" may be very wide of the mark. But as practice makes perfect, so one is enabled to judge fairly closely, by the appearance of the image on the enlarging easel, what exposure is going to be required and a test-strip with but two slightly varying exposures on it will be all that will be required for guidance.

The best way to commence is to fasten down to the easel a piece of the bromide paper sufficiently large to show a characteristic portion of the subject. This is covered with a piece of cardboard, all but one edge. An exposure of, say, four seconds is given to that edge only. Then the card is moved back half an inch, and a second exposure of four seconds is given; then a third half-inch is uncovered, and similarly exposed, and so on until the whole paper has been exposed. It will be obvious that the last strip will have had but four seconds' exposure, while the one first uncovered will have had as many times four seconds as there have been exposures. In the illustration on the next page, there are six such exposures, so that the extreme top of the building (practically invisible in the result!) has had four seconds' exposure, and the bottom strip has received a total of twenty-four seconds' exposure.

When a test piece has been exposed in this way it should be developed for two minutes in a standard developer. It is then rinsed and fixed. If the result is anything like Fig. 3 there should be no difficulty at all in deciding which of the densities is preferred, and so what exposure to give a complete sheet of bromide paper. But it may be that the result is not at all like Fig. 3. It may be entirely like the pale top strip. In that case it would be obvious that one's estimate of exposure was altogether too small. The thing to do would be to start again with another test piece, but in place of making four-second steps, one might well try eight-second steps instead.

On the other hand it might happen that the test piece starts like the bottom strip of Fig. 3, and tails off into blackness. If it does that, it might be the case that the particular brand of paper is a very fast one, and if one reduces the light by stopping-down the enlarger lens a further trial may show this to be the case. But if after this the print still looks dull, it is probable that the contrast of the negative is too delicate for that particular variety of printing paper, or vice versa. One would have the

two possible alternatives of obtaining some paper of more contrasty variety, or of intensifying the negative and having another try with the same paper, afterwards.

But we will hope, and in most cases it does happen, that a result much like Fig. 3 is obtained at the very start, or at most after two or three attempts. I think it will be agreed that the third stripe, with twelve seconds' exposure, looks the best. A print made with that exposure is shown in Fig. 4. But on closer examination it will be seen that the paving, which has caught the light, looks anything but "real." It has "caught the light" and so has printed lighter than the old stone pillars. Reference to the test piece shows that two stripes farther down (the twenty-second stripe) there is more "substance" in the stones, but the pillars begin to lose themselves in darkness in that stripe. By holding a card midway between the enlarger and the easel it

Fig. 4. Middle portion correctly exposed. Foreground too light.

is very easy to give the roadway portion of the picture those extra eight seconds, while screening the pillars when the first twenty seconds have elapsed. The result of doing this is seen in Fig. 5. The line of demarkation between the two portions of the subject is so well defined that I see no harm in getting the idea of local shading even at this early stage. But it is easy to overdo such shading. In Fig. 4 the pavement is much too light in comparison with the pillars, and the picture looks "all over alike." The more critical one gets about such points the sooner one gets in the way of concentrating on the test-strip, and of making accurate judgment from it.

But there are numbers of subjects which do not allow of making a test piece in the way described above. A test made in this way for Fig. 1 would obviously include the face on only one of the stripes, or at the most a bit on each of two adjacent ones. But the face is the principal detail. Without the face good, the rest would go for nothing. There-

fore it is a better plan to cut up a number of small strips and to expose them all each for a different length of time (which can be pencilled on the back). Although it is not at all necessary to lay them in position with the military precision of Fig. 2, at all events it is desirable to include at the same time a bit of the lightest, and a bit of the blackest details on each strip. A point of importance is that they should all be developed for the same length of time in the same strength of developer. It saves a lot of time to expose them all first and to develop them all together, rather than one at a time.

After a very little practice, in place of having an extensive range of strips like Fig. 2 from which to make a choice, one is able to make use of a pair only with the necessary difference between them.

In the foregoing suggestions for making test-strips a series of exposures in arithmetical progression is given, i.e., a series of equal exposures of four seconds each. Many workers, however, advocate and prefer what is known as geometrical progression—such as 4, 8, 16, 32 seconds. In this method each exposure is double the preceding one, and the differences in the developed strip become far more definite. This is particularly useful in those portions demanding long exposures.

Fig. 3. The test-strip.

SCINTILLATE, SCINTILLATE, GLOW BELOW VIVILEX, FAIN WOULD I FATHOM THY NATURE SPECIFIC, LOFTILY POISED IN THE ETHER CAPACIOUS, STRANGELY RESEMBLING A GEM CARBONACIOUS !

We all know that there is more than one way of doing most things, from tying a bowline to pacifying a refractory child. Our heading, whose author we know not, shows us that there is even another way of saying "Twinkle, twinkle, little star!"

There is, however, only one way in which to obtain the finest miniature photographic service in the world, and that is to deal with us. It is no boast that we are the ONLY FIRM CATERING SOLELY FOR THE MINIATURIST: our claim will stand investigation, but, to save yourself the trouble incumbent upon investigating it, why not start dealing with us right away, and thus learn what the finest service in the world is like. All this sounds extremely self-adulatory, but we believe in truth in advertising! "Try 202 for Service!"

The following used cameras are typical of our immense range of second-hand bargains. Although the prices are noticeably lower than those asked elsewhere for similar instruments, every camera is tested and backed by our guarantee. The most generous part-exchange allowances are given, and hire-purchase terms can be arranged over any period up to 24 months.

THE NEW DE LUXE 6×6 AUTOMATIC ROLLEIFLEX

We give below the principal features of this new-comer to the world of miniatures. Any further comment from us would be superfluous, the fine qualities of the Rolleiflex and Rolleicord cameras already being so very well known.

1. Automatic film wind (one action sets shutter, prevents double exposures, and sets delayed-action mechanism).
2. Film counter (avoids necessity for red windows).
3. Built-in self-timer (set, but need not be used, each time film is wound on).
4. F/2.8 finder lens, giving brilliant screen image.
5. Milled disc controls, giving easier manipulation.
6. Peep window for reading shutter speed and lens aperture with ease.
7. All the usual Rolleiflex features.
8. Splendid black and chromium finish.
9. F/3.5 Tessar lens, and Rapid Compur shutter.

The price of this embodiment of all the latest camera improvements is £31 5s., and the ever-ready case £1 17s. 6d. Hire purchase arrangements can be made, and your own miniature will be gladly taken in part exchange.

AUTUMN IS ICUMEN IN!

We cannot ape Shakespeare by saying "Loud sing cuckoo!" but we can say "Don't be Cuckoo!" We know so many miniaturists who, really good judges of cameras, go quite cuckoo when they choose an enlarger for their winter work; why not consult us before investing in your enlarging outfit? Not, mind you, that the thought even enters our head that you might go cuckoo too, but you can never be too sure! We have several suggestions to offer as regards suitable outfits, the following being one suitable for the Leica user:—

1. Leitz Valoy Enlarger; 2, 3 whole-plate dishes; 3, half-gross half-plate bromide papers; 4, Ensign universal measure; 5, Agfa developer to make 200 enlargements; 6, Johnson's acid fixing salt; 7, glass stirring rod; 8, special thermometer; 9, pale red dark-room lamp.

THE ONLY CAMERA OF ITS CLASS!

The Kine-Exakta has the distinction of being the only true reflex camera taking solely 35-mm. film; its distinction, however, does not end there! We have not seen any true reflex camera giving such a brilliant screen image before, and it is also a novelty to have a screen image showing a picture twice the actual negative size. The whole specification of the camera is more than one would have thought possible at the price asked; here is just a selection of its beauties: Takes all standard 36-exposure films. Extra magnifier fitted to hood. Interchangeable lenses, in bayonet mounts. Focussing from 3 feet. Lenses interchangeable with film loaded in camera. Automatic film wind and shutter setting. Picture counter. Automatic shutter lock. Special film cutter, to enable the user to use fewer than 36 exposures. The prices asked for this camera are as follows:

Fitted F/3.5 Exaktar£27 10 0
F/3.5 Tessar£34 10 0
F/2.8 Tessar£38 10 0
F/1.9 Primoplan£45 0 0

how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CDIV.

Mr. W. B.
HOLBROOK.

From information communicated to our Special Representative.

"WHEN a schoolboy I first saw a gaslight print, and the wealth of detail fascinated me. This fascination still holds me. I do not like 'fuzzy' prints except in a very few instances, even when, for some more or less mysterious reason, it has been done intentionally.

"The black-and-white print started my interest in this hobby of hobbies, and I saved up and bought my first camera—a $2\frac{1}{4} \times 2\frac{1}{4}$ roll-film box-form. It was not fitted with a finder, but had two converging lines drawn on the top, and one had to imagine these lines projected on to the subject to find how much was included. I was so keen to try out the camera that

I exposed my first film in the forest, which was so dark that I gave time exposures. Two sections of the six were correctly exposed, and I entered the prints in a Kodak competition, and to my amazement received a guinea. This, as may well be imagined, still further fired my enthusiasm, and I willingly abandoned myself to my photographic fate. Nor have I ever regretted it.

"I am attracted by most photographic subjects—landscape, still life, advertising and commercial; and at the moment I have a craze for portraiture. My latest acquisition is an Ikoflex twin-lens reflex, the negative size of which is the same as that of the first camera I possessed. I use this camera for most of my outdoor work. My holidays are mostly strenuous, and I find the camera a boon when climbing. For more serious, or should I say deliberate, photography I use a $\frac{1}{4}$ -plate Sanderson, for portraiture a half-plate, and for commercial work a whole-plate.

"I use Selo Hypersensitive or Fine Grain films, and develop with Johnson's Fine Grain or Meritol developer by the time and temperature method. For portraiture I use Soft Gradation Panchromatic plates when taking the fair sex, and Golden Iso Zenith for men, developing with Certinal by inspection. I first desensitise the panchromatic plates. For commercial work I use several types of plates according to the subject, and the particular effect I require.

"I use Alpha or Beta filters for outdoor subjects where a better tone rendering is required, and a Micro 5 filter when over-correction is an advantage. I am obviously a Jack-of-all-Trades with regard to photography, but to me this makes it more enjoyable and interesting.

"Although I do not object to any method of control, this must not be noticeable even when very closely scrutinised. Many prints at exhibitions seem to have been worked up with black treacle or something equally objectionable.

"My favourite printing papers are Kodak Royal and Ilford Clorona or Lustre. I develop with amidol for bromides, and the formula given with the paper for Clorona. I strive to obtain pictures which are well balanced both in tone, line and mass, but do not choose my picture and revisit the place later in the hope that the lighting conditions will be more favourable; I just snap what appeals to me at the time I happen to be there. Portraiture I do consider before exposing, and often have to think very hard before a suitable composition and setting can be decided upon.

"I am a student of the Regent Street Polytechnic, and belong to the Walthamstow P.S.; and with their help I have gained much valuable knowledge, and many happy hours, and have found many good friends. I have taken 'The A.P.' regularly since my first camera attempt."

(A further example of Mr. Holbrook's work is reproduced on one of the centre Art pages.)

THOUGHTS OF YESTERDAY

W. B. Holbrook.

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"DAWN," by Rosalind Maingot.

AT the London Salon of Photography, which is now open at 5a, Pall Mall East, there is an extraordinarily fine collection of pictorial work—perhaps the finest and most representative that has ever been brought together—and, included among examples of every class, there are a number of figure studies, draped and in the nude, all of which are admirably treated.

There is a good deal of excellent work in this section, but distinctive even amid so many pictures of a high order of attraction is the set of nudes sent in by Rosalind Maingot, of which this example is typical. This set of prints is extremely good. They are all of imposing scale—the size is somewhere about 20×16 in.—and all are chloro-bromides of very rich quality. The subjects are unusually fine, and while it may be that the artist is fortunate in the models she has been able to obtain that is by no means half the battle, for though it may be an important thing, it is only a trifle towards the making of a picture.

And all of the examples she shows are pictures in the full sense of the word. The beauty of the figures is shown to perfection; posing and arrangement are above criticism; the pictures are characterised by a modelling that is full and rich and round; the flesh tones are admirably recorded; and the subjects are treated with a delicacy and restraint that has hitherto been seldom achieved.

"Dawn" is handled in a higher key than most of the others, and, speaking from memory, I think it is the only one with an out-of-door setting. The atmospheric quality of the background sustains the implication of the title, and its light but fully graded tone is well calculated to set off the stronger and more vigorous contrasts of the figure. But, if they are stronger, the hair is the only real dark of any intensity, and, as the most forceful

note, it naturally attracts the attention to the head, which, of course, forms the centre of interest.

The head comes very near the light on the water, and by force of contrast its attraction is heightened. Further emphasis is accorded by the placing, the head being near, but off, the vertical centre, and, with only the single source of interest, it is about as well

lated, and, at the same time, so well led up to by the lines of the torso and legs, the unity of the composition is achieved and the picture appears thoroughly well put together. There is a certain amount of diffusion in the rendering of the setting, but, in a case like this, I think it is justifiable if only on account of the way it tends to emphasise the decision and sharpness with which the figure is defined. It arises from differential focussing, and, where the figure is on so important a scale, it has the advantage of making it stand out most effectively against a background that is suggested rather than definitely drawn.

Where the figure is on a smaller scale in relation to the remainder of the picture, the modern tendency is towards an equal sharpness throughout, a fact that is emphasised by a great majority of the works on show, and from a careful inspection of them it seems as though the introduction of diffusion for its own sake or for any imaginary pictorial gain is dead. And well may it remain so, but differential focussing, as employed in this instance, is a totally different thing and really does serve a useful purpose.

Here it is admirably managed, and its effectiveness is beyond question. No less effective is the grace of the pose, and while, in other circumstances, there might be some regret that the feet were cut off, the loss is not

felt in this case because of the strong attraction exerted by the head.

Technically, too, the print is first-rate. Its colour is a warm black with something of a reddish tinge on a cream base, and its evenness of texture and the smoothness of its tones are marvellously well done.

I would strongly urge those who are able to do so to make a point of visiting the show—it remains open until the 9th of next month—and of inspecting it for themselves.

"MENTOR."

designed as could be managed. An additional note of strength is derived from the directional impulse imparted by the nearer arm and hand. It indicates the bottom right-hand corner and, while it does not actually follow the line of the diagonal to the top left, it assumes much the same direction and acquires almost as much power as if it did. As, however, it stops short at the head, a yet further accession of strength to that feature is accorded.

With the interest so strongly iso-

By R. R. Linnell.

PICTURES by Novices

SOME CRITICAL COMMENTS on *the Beginners' prints reproduced on the opposite page.*

THERE is little fault to be found with the grouping and arrangement of No. 1 of the prints reproduced on the opposite page—"Outside the Front Door," by C. H. Ramsden. It is very well seen and caught indeed, but it might have been better if the second figure on the left—the one that is partially hidden—had been omitted. It also suffers not a little from the way the features of the figure in the rear are obscured.

A Question of Lighting.

They are rendered in much too dark a tone. Some detail and modulation are visible, and, though under-exposure may be a contributing factor, I am inclined to think that the more immediate cause for the defect is the way the light is falling.

It is coming from the left, and from a source that is somewhat behind the figures. In consequence, only the bare left-hand outline of the face is illuminated. The reflected light from the pavement seems to be insufficient to enable the remaining portion in shadow to show the modelling it should, and, with the lighting as at present, a fuller exposure would do no more than afford a slight improvement.

If the lighting were more definitely frontal, the features, as a whole, would be rendered in a lighter key, and this is really what is needed. For one thing, a greater proportion would be in light, and, for another, there would be more value in the light reflected from below. But the picture had to be taken as it happened. A similar grouping might never recur, and though the fault is regrettable, it would have been a pity to have missed the subject altogether. All the same, the direction of the lighting is a point that should be kept in mind for future occasions, but, for the present, we must consider if by any means a better representation of the subject could be obtained.

Key and Chiaroscuro.

If it were possible to employ a lesser printing depth, or to make a lighter print, it is very probable that an improvement in the way the features of this particular figure are rendered would result. If, however, such a print were made on the same paper, the lighter tones, which are

properly recorded at present, would be lost, and the print, as a whole, would seem weak and washed out.

On the other hand, if the high-light modulation were retained and the lower tones were uniformly raised, the rendering would be acceptable, but the subject would be represented in a much higher key. A scheme of chiaroscuro of this kind—or, in other words, such an arrangement of the light and shade—would differ from a rendering obtained by raising the printing depth, inasmuch as it would not seem washed out but would simply appear to be set forth in tones of greater delicacy.

The negative, in this instance, could not be said to be over-developed for the grade of printing paper employed, nor, strictly speaking, is the latter too vigorous for the negative, but the remedy is the same and a softer grade of paper would enable the required adjustment to be made.

Range and the Print.

Where a too vigorous paper has been used, or over-development exists, the idea in substituting a softer grade is to reduce the range of tone so that at neither extreme is there any lack of modulation.

Here, the intention is still to reduce the range but only to utilise the upper portion. Then, if the printing depth is determined by the modulation in the lights, the darks, including those of the features of the figure, will be recorded in a much lighter tone than they are at present, and where modelling now is scarcely visible it should be fully apparent.

With No. 5, "A Welcome Swill," by T. A. Langley, the details of the face are more in evidence, it is true, but they seem to me to be too sombre, and this, I think, is a case where printing has been carried a shade or so too far. A somewhat lighter print would afford a better rendering, but care would have to be taken that it did not get too light, for if it did, the detail to the rear would be inclined to become over-insistent.

That would never do, and if there seemed to be any danger of such a *contretemps* arising, it might be a feasible proposition to shade the head and shoulders during a part of the printing exposure, keeping the mask

in motion—so as to avoid the appearance of a line of demarcation—during the whole of the time it is brought into operation.

Depth of Printing.

The precise depth to which printing should be carried is largely a matter of opinion and governed entirely by the taste and feeling of the worker.

As reproduced, No. 5 seems too dark, but Nos. 4 and 6, "An Old Favourite," by Harold Dring, and "Luck of the Game," by R. R. Linnell, go to the opposite extreme and appear appreciably under-printed. The dark surround in the reproduction and the conjunction with a heavy print like No. 5 with them may tend to stress their lack of depth, but, on the whole, I feel that the defect exists in themselves and that a greater printing depth is desirable.

It also seems to me that, when that is done, it will be found that, if the same paper be employed, each of the two prints will be too vigorous, so that, when the lights are fully printed the darks will become choked up. If so, it will be necessary for a softer kind of paper to be chosen instead, but I am judging simply from the prints as they stand.

Similar remarks apply, again, to No. 3, "Morris Dancers," by B. W. Bradford, where the light tones of the figures are devoid of modulation, and printing cannot be carried any farther because it would mean over-printing the dark of the background.

Exhibition Prints.

Here again a softer paper would provide a cure, but in No. 2, "Wye Valley," by T. D. Bristow, a nearer approach to a proper range has been achieved.

But if any of my readers wish to get a real idea of what print quality can be, they should pay a visit to the current exhibition of the London Salon at 5a, Pall Mall East; make a careful study of the prints on show; get a supply of printing paper of widely varying grades and contrasts; and then go home and see how near they can get to a similar standard, using the best of their negatives. If a visit there is impossible, refer to the examples reproduced on the centre pages and try and emulate them.

"MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

AUTUMN FOREST SUBJECTS.

WHEN autumn comes we recognise certain differences in the character of our subjects, even if the actual subjects are what we have already been taking during the summer. Conditions and appearances have changed, and very often for the better. The light is inclined, even on the brightest days, to be less harsh and contrasty, and the atmospheric conditions are in our favour—fine skies and pleasant mists.

In my own case autumn always tempts me to the woods, fortunately close at hand. Occasionally I have armed myself with colour plates, more often with ordinary sensitive material, but most often I have gone without a camera at

Fig. 1.

Fig. 2.

all so that I can enjoy the woodland beauty without any preoccupation to distract me.

I have never regarded forest photography as easy. It is a difficult task to isolate a really good subject—to be simple without being inadequate and tame; and the task is certainly not made easier in autumn when the marvellous colouring still further bewilders and misleads. But it is impossible to resist the temptation to try for a few records which shall be suggestive at least. A number of these records, especially if simple and restricted, will together build up some idea of the character of any particular forest. And every bit of forest has its character.

A day or two ago, as an aid to getting accustomed to a new camera, I made a brief incursion into the forest, but was able to do no more than the three subjects shown here. They are nothing much individually, but are an addition to the records I just mentioned.

The camera, by the way, is primarily a hand camera, admirably adapted for quick and unobtrusive "snapshotting." But a forest is no place for snapshots; and I should not have taken this camera but for the fact that it has a focussing screen, and can be used on a tripod. It takes plates or film packs; I was using the latter.

Each of the three subjects was first focussed at $f/3.5$. After getting the definition as good as possible with this aperture, I stopped down to $f/16$, as with most subjects of this kind considerable depth of definition is necessary, and sharp definition at that. The yellow filter on the lens increased the exposure two times, although I make it three times if possible; so that the exposures ranged from $\frac{1}{8}$ to $\frac{1}{2}$ sec. These the shutter gives automatically, a wire release obviating movement even with a light metal tripod. More often than not it is necessary to wait for a moment when there is no movement due to wind.

Fig. 1 is little more than a note of a clump of bracken,

but with other more or less similar subjects it conveys the idea that luxuriant bracken must be a feature of this particular forest, which indeed it is, especially at this time of year. There are masses in which a tall man can stand hidden. An expanse of bracken mixed with purple heather, and with a background of silver birch is shown in Fig. 2, which also is a typical subject.

I was using only ortho film, but a little later this would certainly have to give place to panchromatic material on account of the orange and red colours. In their absence I think good colour values can be secured with ortho material, especially with a yellow filter. In my opinion a most valuable aid to securing good colour values is the avoidance of anything approaching under-exposure. A full exposure and not too full development will work wonders.

In a large print of Fig. 2 there is good gradation of tones in the foreground shadow, and the tiny blossoms on a clump of heather, red as they are, show up as little points of light. At the same time, the light blue of the sky prints out as a distinct tint.

The subject in Fig. 3 is typical of the strong light and shade often encountered in the woods. Its contrast to the eye was astonishing, and I had half a mind to give it best. Except for reproduction purposes I should use a rather softer grade of paper, although in a print I have made on normal paper the contrast is no greater than it actually was.

Fig. 3.

I would advise every beginner who can possibly do so to take his camera into the woods as soon as he can, on a sunny day if possible, and he will be lucky if the day is also windless. He should get something far better than I show here. He should certainly use a tripod, panchromatic material if he is used to it, a filter if he has one; and he should expose fully and develop cautiously. If he is accustomed to working a colour process he should be in his glory.

W. L. F. W.

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with under this heading week by week. Other replies appear as usual on the last page.

Lens and Stops for Enlarging.

Before making an enlarger I want to make sure about the right sort of lens and the stops to use. Can you give me the necessary information?

L. S. L. (Chester.)

The term "enlarger" means so many different forms of apparatus, although all are used for the same purpose, that it is impossible to give definite information that will apply to all cases. We receive an enormous number of queries about enlargers, and we will give some general information on lenses and stops in the hope that you and other readers will receive useful guidance from it.

In the first place the lens should be "corrected" for photographic purposes. Because they are not so corrected many lenses that will project lantern slides on to a screen quite satisfactorily will not answer when transferred to an enlarger. The visual image and the "photographic" image are not on the same plane. The same thing applies to most single lenses fitted to cheap cameras.

For enlarging purposes the proper lens is one that could be used on a camera to give a good negative of a given size. It should give on a focussing screen a properly illuminated and sharp image to the extreme corners; and exposure should result in a negative showing the same qualities. The larger the aperture at which it will do this the better, as will be seen presently.

Hence it has been said that the best lens for the enlarger is that with which the negative was produced in the camera, or a very similar lens. It is a common thing for the same lens to be used for the two purposes, and among the advantages of this is that of economy. There need be no fear of damage to the lens. When leaves of diaphragms or shutters were made of vulcanite the heat caused trouble, but steel has long since supplanted vulcanite.

The advantage of a large aperture in an enlarging lens is that it of course passes more light, and so shortens exposures. It is specially valuable when a condenser is used.

If the light source approximated to a point, and if the condenser were a reasonably corrected lens, it would be possible to focus the cone of rays to so sharp a point that it would pass through an opening of very small diameter. But in practice the light is nothing like a point, nor is the condenser more than roughly corrected; the result being that the apex of the cone of rays is "blunt," and requires an opening about an inch in diameter to pass through.

Such an aperture is easily available nowadays in lenses of about $4\frac{1}{2}$ in. and upwards working at $f/4.5$. The f value of a stop one inch in diameter varies according to the focal length, but the important point is that the aperture must be sufficiently large to pass the cone of rays as completely as possible.

This is the reason for the adoption of Petzval or "portrait" lenses for enlarging. But such lenses do not give sharp definition over the whole field unless they are stopped down, and this stopping down defeats the very purpose for which they are used. Modern anastigmats, with their flat fields, give the necessary definition even at full aperture. They are therefore the best for the purpose. The value of the stop is not the same as when the lens is used on a camera; it is the actual diameter that counts.

The shorter the focal length the less space is required on the enlarging bench. On the whole the ideal to aim at is a lens of the shortest focal length compatible with covering the negative, and approximating to the focal length of the condenser; and used at the largest possible aperture that will give satisfactory definition.

MAKING BETTER SNAPSHOTS-16

By DAVID CHARLES.

This article is the sixteenth of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

Fig. 1. A very bald snapshot, under-exposed through being taken against the light on a dull day.

Fig. 2. A slightly better viewpoint has improved the perspective, but the under-exposure of course remains.

ON return from holiday-making we are inclined to see our place of work in a new light. It looks much more interesting after a brief absence; and as we spend so much of our lives there it is a place of which we ought to have a record.

Fig. 3. Breaking up the foreground, and waiting for a more interesting sky, shows that something can be made of even the ugliest subject.

The other day I came across a young fellow photographing the very uninspiring building you see in Fig. 1. And as I watched him, he walked some little distance backward, and then, after waiting a little while, he made a second exposure, reproduced as Fig. 2. It chanced that

it then began to rain, and as we both took the same shelter I ventured to suggest that I had guessed his reasons for taking the place—his second view had been prompted by a desire to avoid the ugliness of the long brick shed, and that his short wait was for the sky to display some more interesting light and shade. All of which he freely admitted, and then, emboldened by my interest he asked, "What can one do with such an ugly old place?"

So as soon as the rain condescended to stop I suggested we should have a joint look-around. True enough, it seemed at first that the point of view could not be very much bettered, for the narrow path on which we stood ran through a foreground simply littered with great heaps of coal and slag, but the light was dead into his lens, making the building look even 'darker and more drab. It is clear that the coming of the darkened sky in the second exposure had kept 'direct sun out of the lens and had lightened the building by contrast.

Foreground Interest.

So as we strolled and chatted, my eye was caught by the glint of the now improving light upon a shrub beside the path. My newfound friend seized upon it with delight. "Just the very thing," he said, as he admitted he would not have noticed it himself. (But, as I told him, things only catch your eye if you are looking for them.) It was very pleasant to notice the new avidity with which he recognised such details as this and the sandy pathway almost before my finger had pointed them out. He was already learning not to snapshot at first sight, but to make the best possible picture by careful study of the subject.

And so No. 3 was made. The same

shabby old building, the same slag-heaps, but already the scene assumes some little suggestion of romance. At the least we have managed to convey a fairly pictorial impression of what seemed at first a subject almost as absurdly unpleasing as any at which a camera could be aimed.

A Distant Viewpoint.

That perhaps further distance still might lend more enchantment was the gist of my next suggestion; and as we walked along I noticed he had used rather a small stop for the shadow side of a gloomy subject on such a dullish day, and I am afraid the best prints I could make from his negatives do not entirely disguise the inevitable under-exposure. But he did much better at the new viewpoint.

Fig. 4. It looks much better from afar—and if Nature is more magnificent than the works of man, why not award her the lion's share of the space?

Dallan Tele-Anastigmat.

Why a Telephoto Lens?

This is the wording taken from the cover of an interesting booklet written and published by

J. H. DALLMEYER LIMITED

The Inventors and Pioneers of Telephoto Lenses.

Have you received a copy? If not, write or call, or ask your dealer for a copy, and learn of the immense possibilities this modern optical aid places in the hands of photographers and cinematographers.

The House of Dallmeyer have specialised in the design and manufacture of

TELEPHOTO LENSES

since 1891, and to-day offer over 50 different focal lengths and aperture lenses, fitting practically every good photographic or cinematograph camera.

Victor Model 5 with battery
of Dallmeyer Lenses.

A much-favoured line from our Ciné List:

3-in. f/3.5 Telephoto Lens, in micrometer focussing mount, magnification 3 times, 9 times increase in areaPrice £9 4 0

For immediate and interchangeable use on

COLOUR

—simple as black-and-white!

No longer does it mean long exposures, intricate calculations, delicate filters. DUFAYCOLOR does away with all that! You load it in the same way as ordinary film. You expose it in the same way, too. But the result is—natural colour!

DUFAYCOLOR puts the glow of life into the simplest picture . . . children playing in the garden . . . the autumn woods . . . even portraits indoors. 1/25 sec. at f.8 gives ample exposure for such subjects in the middle of a sunny day—while on dull days, though exposures are naturally longer, results are equally brilliant and life-like. Your exposed film is developed by us, and any number of black-and-white prints can be made in addition to the original colour transparency. Buy a DUFAYCOLOR film or pack today! They are made in all standard sizes, including 35-mm. film for miniature cameras, and sub-standard ciné film. **16-mm. and 9.5-mm. Ciné Film also available.** Full information and films at all Photographic Dealers.

DUFAY-CHROMEX LIMITED 14-16 COCKSPUR STREET LONDON S.W.1

Enlarging Difficult Negatives

By A. L. M. S.

IN making enlargements from a number of negatives I recently came across one or two from which it was unexpectedly difficult to make a good print.

The negative from which the illustrations were made falls into this category. It is a miniature negative, and in making a series of rough prints from this particular strip of negatives, this individual one stood out as giving the least satisfactory print.

The print in question was made on a soft grade of paper, and appeared distressingly dull, flat, and grey. To prevent this fault from recurring in the enlargement, a more vigorous paper was chosen, and the exposure was adjusted to bring the sky to a suitable depth. Some misgivings were felt about the landscape portion of the picture, and it was recognised that it might be rather on the dark side, but the result reproduced at the top of the adjacent column exceeded all expectations in that direction.

It is very evident, then, that the grade of paper used for this print was very much too contrasty for the negative.

Yet the preliminary rough print, on soft paper, had been unsatisfactory too, for the opposite reason that contrast was lacking. As a matter of interest, a second print was made on the same grade of paper that had been used for the first, but this time with the exposure adjusted to suit the landscape. It is an excellent representation of the landscape itself, but the sky is utterly blank.

Further experiment resulted in the third print, which is made on a grade of paper intermediate in contrast between that on which the original rough print was made and the much more vigorous paper used for the other two reproduced here. It is probably the best straight print that could be made from the negative.

The whole difficulty arises from the very long scale of tones in the original subject; if this is compressed, by using soft paper, within the range that paper can reproduce, the print looks unnaturally flat, while with a more vigorous paper either some of the lighter or some of the darker tones are lost. With very careful choice of contrast-grade, a print can be made that is an acceptable compromise, but a very small change in contrast either way produces a print in which one fault or the other is very prominent.

Only by shading the landscape while giving the sky extra exposure could the clouds of the first be combined with the landscape of the second, and this result would no longer be what the third can claim to be, a true representation of the tone-values of the original subject. But that does not alter the fact that the "faked" print would probably be the most pleasing of them all.

Secrets of Enlargement Shading

By G. K. SEAGER.

Fig. 1.

I HAVE met people who appear to think that shading portions of the image in making enlargements is allied to trickery, or that use of the method is a sign of bad workmanship in the making of the negative, and is therefore something to be ashamed of. Actually, of course, it is nothing of the sort. The photographer who can translate the tone-scale of his subject, first in the negative and from that to his bromide paper, nicely without any local shading is either very fortunate in the selection of an extremely narrow range of subjects or else he is easily pleased.

The fact is that most of the subjects which make the most attractive pictures have areas of detail which are either extra dense or extra weak in the negative, and which tend either to remain blank or to clog up in enlargements, to an extent which is often nothing like so noticeable in the small contact print. The fact that most skilled photographers, and all professional workers, constantly make use of local shading to get the best results is a sign of its value.

There are two distinct varieties of shading. One is represented by using a disc of opaque substance for holding back an area liable to print too heavily. This is represented by the bit of corrugated card, stuck on the end of a wire skewer, being used to shade the bank of trees in the enlargement being made in Fig. 1. The other kind consists in the use of a much larger card to hold back the main picture, whilst an aperture in it gives extra exposure to a portion. The latter is most usually the sky, but may be a white pavement as in Fig. 2, a bride's white dress, or the sail of a yacht. The latter illustration, by the way, shows also how a second piece of card may be used to adjust the size or alter the outline, of an opening cut in the shading card.

It is rarely practicable to shade, or to print-up, a detail or an area precisely to its outline, and there are wide, though not unlimited degrees to which these methods can be used. The shading-card should be of about such a size that if it is held somewhere around midway between lens and easel it appears to be casting a shadow of nearly the right size, and it has a fuzzy outline. But one does not rely on this fuzzy outline alone; the shading-tool must be kept gently and steadily moving during the whole time it is in use, thereby blending the parts of the picture which have had more or less exposure respectively without the fact becoming evident. If any difficulty is found in cutting (or, better still, tearing) a card to any required outline, this becomes simple if a plain card is held in the midway position described (before putting the bromide paper in position of course) and the necessary shape is sketched upon the projected image on the card.

It is never practicable to use shading with very short exposures, until one becomes really skilled at it. For instance, if a print requires fifteen seconds' exposure, and a deep shadow could do with five seconds less, it takes a good deal of sleight of hand to adjust the shading-tool in position and to give it careful, even movement so that its shadow keeps fairly on the right places, and then to switch off the light, all in the space of five seconds. It is much better to stop the lens down, in such a case, so as to have a longer time in which to perform the series of actions comfortably and serenely.

Fig. 2.

POPULAR-SIZE ENLARGERS

IN our Miniature Camera Number, published on March 10th, we presented a description and a price-list of all the cameras and enlargers for negatives of the generally accepted "miniature" sizes that were at that time on the market. In later issues (those of June 2nd, July 21st, July 28th and August 11th) we extended this review to cover box-form, folding film, folding plate and reflex cameras in the $3\frac{1}{4} \times 2\frac{1}{4}$ and $3\frac{1}{2} \times 2\frac{1}{2}$ sizes. The following pages, which deal with enlargers in these latter sizes, complete our survey of cameras and enlargers in all sizes below quarter-plate.

In these reviews, enlargers are divided into four groups. The first, daylight enlargers, are simple fixed-focus enlargers that produce a print of one stated size from the whole of the negative. Being primarily intended for daylight, which is a more brilliant illuminant than any artificial light, they have lenses of comparatively small aperture, so that even if adapted for use with artificial light, exposures will be long. And it will be evident that the limitation of fixed focus is rather a severe one.

The second group, comprising horizontal enlargers, consists of instruments that will produce work as good as any that a vertical enlarger can turn out, but they are rather more cumbersome in use. Unless a wall is pressed into service, an easel is required to hold the paper, and the whole, enlarger and easel together, occupies a good deal of space. But horizontal enlargers have the not inconsiderable advantage that the maximum enlargement they will give is limited only by the space available.

Non-automatic vertical enlargers are more compact and more convenient to use, the image being projected downwards on to the baseboard and brought to a sharp focus by hand. The maximum enlargement available is here limited by the height of the upright carrying the lantern or projector-head, though in many cases this can be swung round on its upright to project its image past the baseboard to a piece of bromide paper held on an improvised support at a lower level. Used in this way, the only limit to the degree of enlargement is set, as with the horizontal enlarger, by the maximum distance that can be arranged between lens and paper.

The vertical enlargers with automatic focussing are the most convenient of all to operate, the image changing in size as the head is raised and lowered, but remaining sharp all the time. Generally this convenience has to be paid for—in loss of flexibility as well as in cash. Most enlargers of this type cannot be used for greater magnification than can be obtained by projection on to the baseboard itself, as swinging the head round would destroy the adjustment of the focussing mechanism. There are, however, exceptions to this, and one or two enlargers combine the flexibility of the ordinary type with the convenience of automatic focussing.

The brief description of the various instruments given below indicate, in almost telegraphic language, the most essential features of each enlarger. The points picked out for emphasis are those on the basis of which an intending purchaser could decide whether the enlarger in question is, or is not, among those likely to suit his needs; for further details he is referred to the manufacturers or agents, whose addresses should be sought in our advertisement pages. With these reviews to help him, a purchaser should neither overlook an enlarger which might suit him nor waste his time enquiring for details of any that do not meet his particular needs.

The question of price is often an important one; at the end of the reviews there is a summary in which the price of each enlarger, complete with optical equipment of one or more kinds, is laid out in tabular form. The third column of this includes the range of enlargement, in diameters, that each model will give, it being understood that an instrument that will enlarge 10 diameters will produce a print 25×35 inches from a negative of size $2\frac{1}{2} \times 3\frac{1}{2}$ inches. An asterisk following the degree of maximum enlargement means that the projector-head can be turned to project off the baseboard for still greater magnification.

Daylight Enlargers.

DAORNYTA.

Fixed-focus enlarger, enlarging to postcard size, half-plate or whole-plate, according to model. Has diffusing screen over negative to allow any light source to be used. Fitted achromat lens with exposing shutter. Price, from £1.

J. Lancaster & Son, Ltd.

ENSIGN DAYLIGHT.

Simple fixed-focus enlarger, fitted achromat lens with shutter. Enlarges to postcard size or half-plate according to model. Price, from 17s. 6d.

Ensign, Ltd.

Horizontal Enlargers.

"CONDENSER" No. 2.

Horizontal enlarger for electricity, incandescent gas or acetylene, using double condenser and diffusing screen.

Focussing by quick-thread screw, the extension being sufficient to allow reduction. Reversible negative carrier with rotating, falling, rising, and cross movement. Supplied with or without lens, or without focussing movement to take user's camera and lens. Price, from £3 10s. according to equipment.

J. Lancaster & Son, Ltd.

"CONDENSER" No. 4.

A *de luxe* version of the No. 2 "Condenser" enlarger, with rack and pinion swing movement to negative carrier.

Price, from £5 15s. according to equipment.

J. Lancaster & Son, Ltd.

HORIZONTAL MAGNAPRINT.

Simple horizontal enlarger with manual focussing. For electricity only, using double condenser. Fitted 105-mm. f/6.3 anastigmat. Price £5 15s.

Ensign, Ltd.

DIFFUSA H.M.

Simple horizontal enlarger for electric light only, using two 60-watt clear lamps with reflector and diffuser. Can be obtained as attachment to which user's camera and lens are fitted, without lens,

or fitted with 4-in. achromat or anastigmat lens. With 4-in. lens enlarges from $1\frac{1}{2}$ diameters upwards. Price, from £1 7s. 6d. according to equipment.

J. Lancaster & Son, Ltd.

MARVEL.

Simple horizontal enlarger for elec-

tricity, incandescent gas, or acetylene. Fitted double condenser and sliding focussing movement. Can be had with or without lens, or without focussing movement to take user's camera and lens. With standard lens sufficient extension for reducing is provided. Price, from £2 according to equipment.

J. Lancaster & Son, Ltd.

MIRAX. (Enlarging Attachment.)

This is essentially a lamphouse with stand to which is attached a camera, the whole making an enlarger which can be used horizontally or vertically. For electricity only, using special bulb. No condenser is used. With stand for

horizontal use, price £3 5s. 6d.; stand and easel for vertical use, £1 17s. 6d. extra.

Messrs. Zeiss Ikon Ltd.

Non-Automatic Vertical Enlargers.

AMPLUS No. 2.

A vertical enlarger with manual focussing, for either electricity or incandescent gas. Can be obtained complete with lens, to take user's lens, or without focussing arrangement to take user's camera and lens. With 4-in. lens enlarges from 1½ to 5 diameters, greater enlargement being obtainable by projecting off baseboard. Baseboard takes paper up to 12 × 10 in. Price, from £2 17s. 6d. according to equipment.

J. Lancaster & Son, Ltd.

AMPLUS No. 4.

Vertical enlarger for electricity or incandescent gas. Fitted double condenser and optional diffuser. Semi-automatic focussing by scales on pillar and focussing arrangement. Can be supplied complete with lens, to take user's lens, or without focussing arrangement to take user's lens and camera. With standard 4-in. lens reduces to half-size or enlarges to 6 diameters. Can be fitted with 3-in. lens giving enlargements to 9 diameters. Still greater enlargement obtainable by removing paper board, and projecting through base. Price, from £5 10s. according to equipment.

J. Lancaster & Son, Ltd.

DIFFUSA V.M.

Simple vertical enlarger consisting of Diffusa H.M. mounted on vertical pillar which clamps to table. With

4-in. lens enlarges 1½ to 4 diameters, or more if arranged to project image off table. Price, from £1 15s. according to equipment.

J. Lancaster & Son, Ltd.

FILMAREX MODEL IV.

Specification exactly as Filmarex Model III, except that it has a taller lamphouse accommodating a double condenser. Price £21.

R. E. Schneider.

FILMAREX MODEL III.

Vertical enlarger with manual focussing, over a range of enlargement from 1½ to 7 diameters. Greater enlargement can be obtained by swinging the lamphouse round on the upright. Fitted for electricity only, using a 100-watt pearl lamp in conjunction with diffuser. Fitted 10.5-cm. f/4.5 double anastigmat with iris. Baseboard takes paper up to 20 × 15. Can be fitted with interchangeable lens giving enlargement to 13½ diameters from 4 × 4 cm. negatives. Price £17 17s.

R. E. Schneider.

LUMIMAX.

Vertical enlarger with manual focussing by rack and pinion. For electricity only, using either condenser or diffuser. Fitted with 10.5-cm. f/4.5 Ihagge anastigmat, which has a fixed stop for f/6.3. Will enlarge from 1½ to 4 diameters, but lamphouse can be turned round to project off baseboard where greater enlargement is required. Price £9 12s. 6d.

Messrs. Garner & Jones, Ltd.

MAGNAPRINT V/II.

Vertical enlarger with manual focussing by helical mount. For electricity only, using double condenser and 100-watt opal lamp. Fitted with f/6.3 or f/4.5 anastigmat, it enlarges from 1.3

to 5½ diameters. This range can be extended by projecting off the baseboard, which will take paper up to 15 × 12 in. Price, from £9 10s. according to lens.

Ensign, Ltd.

PERFECTA.

Vertical enlarger with focussing by rack and pinion. For electricity only, using 4½-in. double condenser. Fitted with 4-in. f/4.5 Dallmeyer anastigmat. Enlarging from same size to 4 times. Can be fitted if preferred with 3½-in. lens giving enlargement to 5½ times. Head cannot be swung round for greater enlargement. Baseboard takes paper to 15 × 12. Price £5 12s. 6d., without lens.

Thornton-Pickard Manufacturing Co., Ltd.

PRAXIDOS O.

Vertical enlarger with manual focussing by focussing mount. For electricity only. Uses 100-watt opal lamp in conjunction with a diffuser, or a projection lamp if used with a condenser. Fitted with 10.5-cm. f/4.5 anastigmat with iris diaphragm. Enlarging 1.6 to 7 diameters. For greater enlargement the lamphouse can be swung clear of the baseboard. Maximum size of paper accommodated on baseboard, 20 × 16 in. Price, from £14 according to equipment.

Messrs. Sands Hunter & Co., Ltd.

PRAXIDOS (NEW MODEL).

Vertical enlarger with manual focussing by screw adjustment. For electricity only, using 100-watt opal lamp in conjunction with diffuser, or a projection lamp with a condenser. Fitted with interchangeable 10.5-cm. f/4.5 anastigmat with iris diaphragm. Enlarges 1.6 to 7 diameters. Projector head can be swung clear of the baseboard for greater enlargement. Baseboard will take paper up to 20 × 16. Price, from £15 according to equipment.

Messrs. Sands Hunter & Co., Ltd.

RAJAH.

Vertical enlarger with manual focussing by helical mount. For electricity only, using double condenser fitted with 90-mm. f/4.5 anastigmat without iris, giving enlargement from 2 to 6

diameters. The projector head can be swung round for greater enlargement. Baseboard will take paper to 20 × 16 in. Price complete £15 15s.

Messrs. Norse Trading Co. (London), Ltd.

"VYBOO."

A vertical enlarger with manual focussing. For electricity only, using either double condenser or completely diffused light as desired. Fitted 9.5-cm. f/4 anastigmat with iris. Range of enlargement from 1½ to 6 diameters. Can be fitted with 5-cm. lens for miniature negatives, when the range of enlargement becomes from 1½ to 13 diameters. Baseboard will take paper up to 20 × 16 in. Price, complete with condenser, £32 19s.

Messrs. E. Leitz Ltd.

"VY00S."

Specification similar to that of Vyboo, but uses taller upright, extending the range of enlargement possible to 9½ diameters with a 9.5-cm. lens, and to 19 diameters with a 5-cm. lens. The baseboard will take paper up to 24 × 20 in. Price £34 8s. 6d.

Messrs. E. Leitz Ltd.

Automatic Vertical Enlargers.

AUTO-AMPLUS No. I.

Vertical enlarger with automatic focussing for enlargements from 1½ to 4 diameters. For electricity only, using two lamps, reflector, and diffuser. Supplied with 4-in. anastigmat with

sliding stop for f/11, or with iris at an extra charge. Baseboard will take paper to 15 × 12 in. Price, from £7 10s. according to lens.

J. Lancaster & Son, Ltd.

AUTO-AMPLUS No. 2.

Specification as Auto-Amplus No. 1, but fitted for electricity or incandescent gas in conjunction with double condenser. Price, from £8 12s. 6d. according to equipment.

J. Lancaster & Son, Ltd.

AUTO-AMPLUS No. 6.

Vertical enlarger with automatic focussing, fitted for electricity or incandescent gas in conjunction with double condenser. Alternative diffusing arrangements are included. Can be obtained without lens, or with 4-in. lens giving enlargements to 9 diameters, or reductions to half-size. With 3-in. lens it enlarges to 13 diameters. Baseboard takes paper to 20 × 16 in. Price, without lens, £11.

J. Lancaster & Son, Ltd.

EXAKT (MODEL III).

Vertical enlarger with semi-automatic focussing obtained by adjustment of scale on lens mount to correspond with scale on pillar. For electricity only, using opal lamp with double condenser. Normally fitted with 10.5-cm. f/4.5 anastigmat without iris diaphragm. Enlarges 1.7 to 6.3 diameters. Baseboard will take paper up to 20 × 16 in. Can be fitted with 6-cm. lens interchangeable with standard for enlargement 4½ to 13 diameters from negatives up to 4 × 4 cm. Price, from £20 5s.

Messrs. R. F. Hunter Ltd.

EXAKT (MODEL IIIa).

Identical with Exakt Model III, except that it has a longer pillar enabling it to give enlargement up to 8.4 diameters with standard lens, or 16 diameters with 6-cm. lens. Price, from £23 5s.

Messrs. R. F. Hunter Ltd.

FAM MODEL V.

Vertical enlarger with automatic focussing over range 1½ to 7 diameters, but lamphouse can be swung round to project off baseboard for still greater enlargement. For electricity only, using 100-watt pearl lamp in conjunction with diffuser. Fitted 10.5-cm. f/4.5 anastigmat with iris. Baseboard will take paper up to 20 × 15 in. Interchangeable lenses for greater enlargement from smaller negatives can be fitted. Price £21.

R. E. Schneider.

FAM MODEL VI.

Specification exactly as Fam Model V except a taller lamphouse is incorporated

ated and a double condenser fitted. Price £25.

R. E. Schneider

FOCOMAT MODEL II.

Vertical enlarger with fully automatic focussing. For electricity only, using double condenser. Fitted 9.5-cm. f/4 anastigmat with iris. Range of enlargement from 1.8 to 6 diameters, this range

being increased to 9 diameters by using manual focussing. Lenses of shorter focal length can be fitted for use with negatives up to 4x4 cm. This gives enlargement from 2 to 15 diameters with automatic focussing and up to 18 diameters with manual focussing. Price, with 9.5-cm. lens, £50 12s. 6d. Messrs. E. Leitz Ltd.

MIRAPHOT.

Vertical enlarger with

automatic focussing. For electricity only, using special lamp with reflector and diffuser. Fitted with f/6.3 Novar or f/4.5 Tessar lens. Enlarges from 1½ to 3½ diameters. Lamp-house cannot be swung round for greater enlargement.

Price, from £8 2s. 6d. according to lens and equipment.

Messrs. Zeiss Ikon Ltd.

MAGNAPRINT AV/11.

Vertical enlarger with automatic focussing. For electricity only, using

100-watt opal lamp and double condenser. Fitted 4-in. f/4.5 Dallmeyer anastigmat. Enlarges from 1.3 to 5½ diameters. Lamp-house cannot be swung for projecting off baseboard, which takes paper up to 15x12 in. Price £13 10s. Ensign, Ltd.

AUTOMATIC PRAXIDOS.

Vertical enlarger with automatic focussing, giving a range of enlargement from 1½ to 7 diameters. Fitted with an 11.5-cm. f/3.5 anastigmat with iris diaphragm in interchangeable mount. For electricity only, using 100-watt opal lamp with diffuser, but can be fitted with a condenser if preferred. An interchangeable lens for obtaining enlargement up to 12 diameters from 24x36 mm. negatives can be fitted. The baseboard takes paper up to 20x16 in. Price, from £24 according to equipment.

Messrs. Sands Hunter & Co., Ltd.

VERTEX AUTOMATIC.

Vertical enlarger with fully automatic focussing. For electricity only, using either diffuser or condenser. Model 331 has 10.5-cm. f/4.5 three-component anastigmat, Model 333 has f/3.5 four-component anastigmat with iris diaphragm. Range of enlargement from 1½ to 6 diameters. Baseboard will take paper up to 15x12 in. Price, with

diffuser and f/4.5 lens, £19 19s. Messrs. Actina Ltd.

The Week's Meetings

Thursday, September 23rd.

Camberwell C.C. Finlay Colour Process Simplified. J. H. Clark.
Hackney P.S. Outing. Kensington Gardens.
Liverpool A.P.A. Informal Meeting.
North Middlesex P.S. "Bromide Enlarging." R. D. Friend.
Oldham P.S. "Norway." Miss M. Wareing.

Friday, September 24th.

Royal Photographic Society. "Enchanting Norway." F. R. Newens.
Brighton and Hove C.C. Committee Meeting.

Saturday, September 25th.

Armley and Wortley P.S. Ramble. Adel Woods and Seven Arches.
Bournemouth C.C. Exhibition Dinner at Gervis Hall.
Ipswich and D.P.S. Gifford's Hall and Stoke-by-Nayland.
Leicester and Leicestershire P.S. Outing to Swithland Woods and district.
Liverpool A.P.A. Unofficial Trip to London Shows.
North-West London C.C. Outing in Hampstead.
Nottingham and Notts P.S. Clifton Hall. F. W. Ricks.
Sheffield P.S. Burbage. J. Mason.
S. Suburban and Catford P.S. Outing to Romney Street. F. J. Ashby.
Stourbridge P.S. Werneth Low. F. V. Hadfield.
Wimbledon Ciné C. Programme of Films.
Woolwich P.S. Well Hall. Mr. Perry.

Sunday, September 26th.

Hanley P.S. Trentham. T. Parker.
Ilford P.S. Chelmsford to Danbury. Mr. Roughton.
Wimbledon C.C. Wimbledon to Bookham.
Worthing C.C. Outing to St. Leonards Forest by coach.
York P.S. Yorkshire Wolds.

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Monday, September 27th.

Bexley Heath P.S. "Bromide, the Protean Process." F. H. B. Smith.
Bournemouth C.C. Annual General Meeting.
Hampshire House P.S. Ripley. N. W. Wilding.
Kinning Park Co-op. C.C. Holiday Outing—Maybole.
Leeds C.C. Isle of Man Competition Slides.
Oldham Equitable P.S. Portraiture Demonstration. J. H. Bardsley.
Southampton C.C. Monthly Print Competition Evening. W. R. Kay.
Stourbridge Inst. P.S. "Portraiture." Miss D. Wilding.
Walthamstow and D.P.S. Annual General Meeting.

Tuesday, September 28th.

Royal Photographic Society. "X-Rays in Science, Art and Industry."
Blackpool and Fylde P.S. Monthly Meeting at H.Q.
Bridge of Allan P.S. Annual General Meeting.
Hackney P.S. Print Competition. "Sunshine."
Halifax P.S. "Types of Architecture." W. H. Wilkinson.
Harrow C.C. "Some Problems of the Printing Process." J. A. Hall.
Manchester A.P.S. Social Evening and Dance.
Newport C.C. Demonstration—Enlarging. H. B. Redmond.
Nottingham and Notts P.S. Annual General Meeting.
Oldham P.S. Council Meeting.
St. Bride P.S. Exhibition Evening.

Wednesday, September 29th.

Brighton and Hove C.C. "A Trip to the Hebrides." E. Cecil Curwen.
Hall Green P.S. "The Amateur Photographer and Cinematographer" Slides.
South Essex C.C. Print Criticism.

Exhibitions and Competitions

CURRENT AND FUTURE.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, September 30. Rules in the issue of August 25.
The Amateur Photographer Novices' Competition.—Special prizes of supplies of films. Latest date for entries, September 30. Particulars in this issue.

Wallace Heaton Competition. Cash prizes every week.—Open to readers of *The Amateur Photographer*. Full particulars in advertisement page in this issue.
Nuro Competition.—Cash prizes every month. Special prizes for boys and girls under sixteen. Full particulars obtainable from any photographic dealer, or from Nuro Ltd., Biggleswade, Bedfordshire.

Isle of Man Sixth Annual Amateur Photographic Competition, £300 cash prizes.—Open until September 30. (P. A. Clague, Publicity Department, Isle of Man.)

"Daily Mirror." "Nushots" Weekly Photographic Competition. Cash prizes. (The Editor, "Daily Mirror," Fetter Lane, London, E.C.4.)

XVle Salon International de Photographie de Belgique.—Open, May–October. (M. Julien Lejeune, 70, Av. Van Becelaere, Boitsfort, Brussels.)

XXXIle Salon International d'Art Photographique de Paris.—Open, October 2–17. (Le Secrétaire, Société Française de Photographie et de Cinématographie, 51, Rue de Clichy, Paris (9e).)

I International Exhibition of the Photo-Press and Literature (Jugoslavia).—Open, October. (Fotoklub Zagreb, Masarykova II, Zagreb, Jugoslavia.)

Royal Photographic Society of Great Britain, 82nd Annual Exhibition.—Open, September 11–October 9. (The Secretary, Royal Photographic Society, 35, Russell Square, W.C.1.)

Professional Photographers' Association Annual Exhibition, Princes Galleries, Piccadilly W. "Photography in Commerce and Industry"—September 17 to September 29.

3e Internationale Focus Fotosalon, Amsterdam, Holland.—Open, September 11–26. (Focus, Ltd., Fotosalon, Bloemendaal, Holland.)

London Salon of Photography.—Open, September 11–October 9. (The Honorary Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.)

Anthracite Salon of Photography, Everhart Museum, Scranton, Penna, U.S.A.—Open, September 18–October 4. (Salon Director, Everhart Museum, Scranton, Penna, U.S.A.)

The Victorian International Salon.—Open, October 18–30. (C. Stuart Tompkins, The Junction, Camberwell, E.6, Victoria, Australia.)

International Photographic Exhibition, Budapest.—Open, October. (Modern Magyar Fényképezok, VIII, Rákóczi-ut 19, Budapest, Hungary.)

Windlesham Camera Club.—Open, October 21–23. Last day for entries, October 2. (J. C. Hayward, Hallgrove, Bagshot, Surrey.)

Fourth Canadian International Salon of Photographic Art.—Open, October 23–November 15. (Exhibition Secretary, Canadian International Salon of Photographic Art, The National Gallery of Canada, Ottawa, Canada.)

Rotherham Photographic Society Forty-eighth Annual International Exhibition.—Open, October 12–16 inclusive. (E. G. Alderman, Ruardean, Newton Street, Rotherham, Yorks.)

Sixth Irish Salon of Photography.—Entries, September 25; open, October 30–November 6. (The Hon. Secretary, 18, Morehampton Road, Dublin.)

"Irish Travel" Photographic Competition, 1937. Cash prizes.—Entries, September 30. (The General Manager (Photo Competition), Irish Tourist Association, 14, Upper O'Connell Street, Dublin, I.F.S.)

Cyclists' Touring Club (Metropolitan D.A.) Second Annual Photographic Competition.—Entries, September 30; open, October 28–30. (G. H. Craddock, 9, Lady Margaret Road, Kentish Town, N.W.5.)

Lincoln C.C. Eleventh Annual Open Exhibition.—Entries, October 1; open, October 29–November 26. (Miss E. Redfern, 8, Cecil Street, Lincoln.)

G.E.C. (Coventry) P.S. 4th Annual Exhibition.—

Entries, October 14; open, November 8–13. (C. W. Crowe, G.E.C. (Coventry) Photographic Society, General Electric Co. Ltd., Coventry.)

Bournemouth C.C. Open Exhibition of Pictorial Photography.—Entries, October 18; open, October 25–30. (John Reid, Westminster Hall, Beacon Road, Bournemouth.)

International Salon Oval Table Society, Inc.—Entries, October 23; open, November 16–30. (Oval Table Society, Inc., 10, W. 23rd Street, New York.)

1st Rhode Island National Salon of Photography.—Entries, November 1; open, November 15–30. (J. Clement Grimes, 103, Westminster Street, Providence, Rhode Island, U.S.A.)

International Photographic Exhibition in Debrecen (Hungary).—Entries, November 20; open, January. (Aszmann Ferenc, Ferenc Josef ut 27, Debrecen, Hungary.)

Xie International Fotosalon "Iris".—Open, January, 1938; last day for prints and entry forms, November 30, 1937. (F. Geeraerts, Brederodestr. 22, Antwerp, Belgium.)

Second Indian International Salon of Photographic Art.—Entries, January 15; open, March, 1938. (N. B. Cooper, Hon. Sec., Camera Pictorialists of Bombay, 53, Nicol Road, Ballard Estate, Bombay, India.)

Leicester and Leicestershire Photographic Society's International Exhibition of Pictorial Photography.—February 21–March 12, 1938. Last day for entries, January 29, 1938. (H. Foscutt, 19, Doncaster Road, Leicester.)

Edinburgh Photographic Society 76th Annual Open Exhibition.—Open, March 9–April 2. Entries, February 28. (John S. Rodger, 16, Royal Terrace, Edinburgh.)

Runcorn C.C. Open Exhibition.—Entries, February 18; open, March 23–26, 1938. (R. J. Edwards, 1, Waterloo Road, Runcorn, Cheshire.)

"The A.P." SPECIAL COMPETITION FOR NOVICES

THIS competition is specially for Novices, that is to say, those amateur photographers who have never won an award of any description in a photographic competition, and preferably those who are only just starting photography.

The prizes will be awarded for the best snapshots of subjects that the beginner usually attempts. These include snapshots of the family, groups or single figures taken at home or on holiday, either indoors or outdoors, and landscape and beach scenes, etc., with figures. The arrangement of the subject and the pose of the figure or groups is a matter left entirely to the discretion of the competitor.

The entries will be restricted to contact prints and enlargements of standard "Enprint" size, which do not exceed 4½ × 3½ in., even if made from the whole negative. These may be mounted if preferred, and the smallness of any print will not affect its careful consideration in this competition. The rules are very simple, but should be read carefully.

THE PRIZES.

The prizes in this competition will consist of supplies of roll film or plates (for those winners who happen to use a plate camera), as follows:—

The First Prize will be TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.

The Second Prize will be TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.

The Third Prize will be ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.

Twelve Prizes of ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

RULES.

Each print must have affixed firmly to the back a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor. The latest date for receiving entries is September 30th.

The copyright of all prints entered remains the property of the authors of the photographs, but the right is reserved by "The A.P." to reproduce the winning prints and any others that may be worthy of mention. The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed to: The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices' Competition."

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Editing the Holiday Film By NORMAN DYER.

AT this time of the year, the ardent amateur cinematographer, freshly returned from what has been, we hope, a refreshing change from the normal routine of life, finds himself faced with the task of arranging in some presentable order a large and probably very varied collection of shots which in time will constitute that annual outburst of all amateurs known as the "holiday film."

Memory Helps.

The first impression on surveying this mass of material is generally one of despair that the job will ever be possible, this, in conjunction with the spirit of *laissez-faire* engendered by the holiday, usually results in the continual postponement of the task. Now this is definitely not all to the good, as it is far better to do it when the actual scenes are still fresh in the mind. There is no real reason why the editing should present any real difficulties, and it is hoped to give some hints that will help to make it an easier matter.

If the film has been more or less planned in advance, as it should, there will be no difficulty, as the general lines on which the material will be assembled will be known. Probably, however, this will not have been done, such being the way of most amateurs, and the first job then becomes to make sure of exactly what has been taken. By this is meant that the reels of film should be projected, several times if necessary, and notes made of the different shots, an abbreviated list of which should be attached to each reel for identification later.

A Sequence of Ideas.

Having done this, it then becomes necessary to decide on the general arrangement of the film, and for this an appreciation of the word "continuity" is required. Now "continuity" can mean several things in cinematography, but in connection with the holiday film it means simply that the various sequences and shots should be so arranged that the completed film will "flow" smoothly, each scene merging into the next without any awkward "jumps."

This does not mean that each scene must be faded into the next, or anything like that, but simply that material in each shot should match that of the preceding and following shots, either by an obvious visual connection or an association of ideas.

As an example, say that there is a sequence of a seaside town, with shots

of activities on the beach, in the harbour, and some views of old parts of the town. Now to follow, say, a shot of games on the beach directly with a shot of the old church would be an example of very bad continuity, for there is obviously no connection of any kind between them, and the sudden transition would give a mental jerk to the audience, which, in this case, is not wanted.

Achieving Continuity.

The proper way would be to follow the beach scenes by those of the harbour, for the suggestion of the sea is contained in both; this connection could be heightened if the last beach shot could show, say, the harbour in the distance or a vessel approaching the shore, etc. Then could come the town scenes, again introduced, perhaps, by a shot of the harbour in which a portion of the town appeared or something similar. Each individual film will, of course, need its own special treatment, but these are the general lines to work on, remembering to keep a watch out for those "linking" shots.

This type of linking shot can quite evidently only be taken during the holiday itself. Other kinds of link, however,

can often be fitted in afterwards. The audience could be brought from beach to town by following a picture of a man painting a boat with one of a painter at work on a building. If a close-up, the latter may be taken almost anywhere without giving away the fact that the link is a manufactured one.

Titles can, of course, be used in a similar way, but it is better, if possible, to dispense with them as much as possible, relying on the visual links and reserving titles for use between sequences dealing with different places. Here, too, a "continuity shot" of some form of transport, inserted just before the title, helps to maintain a smooth effect.

Final Improvements.

Having assembled the film roughly on these lines, with a piece of blank film where the titles will go, it should then be projected. Probably some alterations will be thought necessary. This process of viewing and cutting must be continued until it is considered that no further improvement can be made. The titles can now be inserted, and the film is complete, and is, we hope, a credit to its maker.

An ideal subject for the maker of documentary films. This represents the laying of new tramlines on the Embankment, but is a phase of activity that can be found at all times in all towns. "Road Up" would make a good title, and the various inconveniences caused would provide material for a film of considerable length.

How to Use Titles ^{By} S.E.L.M.

A PART from the obvious requirements of clarity, terseness, etc., there are three general rules—and three only—which should concern the work of titling. They are :—

(1) To avoid using titles which are not essential to the run of the film.

(2) To use them generously where they serve to strengthen the film content or where the shots themselves do not contain an adequate explanation.

(3) To work for a "caption climax" wherever the filmic material is unable alone to reach its great moment—or alternatively, to intensify an existing (image) climax.

All workers should, in every film they make, observe the two first of these rules. The other is one in which some experience of expressive cutting is essential; and, for this reason alone, young workers may ignore it until such time as they have acquired some proficiency in the art of editing. Without this latter, the device is apt to be somewhat misapplied—emerging as titles wrongly placed or unnecessarily used.

Very little of the above is written to concern main titles. They have a sanctity—even a technique—of their own, hence the remarks referred to are not generally applicable to them.

Examples to Follow.

In "The Last Laugh," we have an example wherein the first of these general rules has been carried to extremes—without any sacrifice of perfection. Its makers and, indeed, nearly all the post-war German workers were experts in the observance of both this and the second rule. Unfortunately, the various abridged versions of their other films, particularly those on 9-mm. positive, have lost some of their force in this connection; yet sufficient persists to stamp them still as examples worth following.

All the lessons contained in these examples are particularly easy to assimilate. In the latter days of the professional silent film, however, the use of titles was becoming more "clever" than significant. The lessons are not nearly so easy—hence it is refreshing to see fairly recent productions in which the earlier, effective uses of the caption have been revived. H. A. Green's "Dock Workers," the British Commercial Gas Association's "Nutrition," and Norman Reid's "Penny Wise" are amongst the better-known films in point, though many other shorts equipped with effective captions are making their way into the various news-reel theatres.

Probably the earliest use of the title in assisting a film climax occurs in Eisenstein's "Battleship Potemkin." Years before, it is true, Griffith had suggested the possibilities of such a device (in his film, "Intolerance"), but the only effect he successfully strove for was one of suspense preceding a very fine image climax. The device as used in the final, Black Sea, sequence of Eisenstein's classic is a great advance upon this and should be studied by all who have to deal with the editing of films.

"Turk-Sib," too, shows another development in the use of climax titles. Here the same caption is interposed time and again to turn a few almost-banal shots into a culmination seldom if ever excelled. Michael Burke adopts a similar treatment in his "Revolt of the Fishermen"; and in another film, "Bread," he not only repeatedly cross-cuts two titles, but takes the separate words of his final four-word title and projects them individually in letters of a constantly increasing size.

All the productions mentioned above have been shown in England, and most can now be obtained on sub-standard film stock from the libraries of Messrs. Pathé and the Film and Photo League, at very low rates.

A Simple Film-Cleaner ^{By} D. CHARLES OTTLEY.

OIL on the film, as most amateurs know, is difficult to avoid, especially at the beginning and the end of reels.

It is equally difficult to remove. Although not actually detrimental in itself, in so far as the chemical composition of the base is concerned, the presence of oil causes dust, fluff and all manner of unwanted matter to adhere to the film, both during its passage through the projector and after, when handled for rewinding. For this reason it is advisable to systematically remove all traces of oil regularly, in fact as regularly as the film is rewound.

The little piece of apparatus described here is designed to fit on the rewind board, between the two spool arms, and is

simple enough for the merest novice to construct. In essence the gadget consists of three rollers, two of which are made of wood (reels upon which thread has been wound will serve) and the third of tin (an empty "Bondman" tobacco tin of the 1-oz. size being suitable, or something similar).

Each of the wooden rollers is covered with a small piece of good quality velvet stuck to the surface by "Seccotine" or

"Mendine." The tin roller is also covered with velvet, but before doing this a small slot is cut from the outer edge to the back, the cut being extended for about three-quarters of an inch round the back circumference to allow the tin of one of the edges being turned in a circular fashion *inwards*, as shown in the sketch. Through the slot is threaded the end of a three-quarter-inch first-aid field dressing (bandage), the remainder of the roll being accommodated in the tin itself.

It is now necessary to mount the three rollers upon a short piece of wood about half an inch thick, the tin roller being in the centre and the others about half an inch away on either side. None of the rollers being required to revolve freely, the fixing is a very simple matter. The tin roller must be so mounted that its lid is removable.

The illustration makes clear the method of erection, it being noted that the bandage end (from the centre roller) is carried through the slot, over the velvet, thence to a spring-clip clothes peg that holds it taut. The two end rollers deal with the non-emulsion side of the film and the centre one with the emulsion side.

At least twice during the rewinding of a reel the bandage should be moved forward about half an inch, so that a clean surface is presented to the film face. The clothes peg opens sufficiently to retain the entire bandage if same is folded as per the conventional method of folding tape. When the entire length has been used it can be washed, preferably in soft water, rewound and used again.

It is necessary to take a little longer over rewinding, particularly if dealing with a notched 9.5-mm. band, and on no account should a geared rewinder be employed. The gadget as above described has been used by the writer for some considerable time with entirely satisfactory results. The cost of the first-aid dressing ranges from 9d. to 2s. 6d., according to length and quality. The best quality dressing should be obtained even though its length is reduced. For the purpose of the cleaner just described a 30-ft. three-quarter-inch roll will suit admirably. As is customary, the fingers of the left hand should rest lightly against the edge of the spool that is emptying during the operation of rewinding.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS

Arrangements for the 30th Scottish National Salon, which will be held in the Scottish Woollen Technical College, Galashiels, from Saturday, 2nd, to Saturday, 16th April, 1938, are already well advanced. The Salon this year is being arranged by the Galashiels Camera Club, and entry forms, which will be ready early in October, may be obtained from Mr. Percy H. Cartwright, 52, High Street, Galashiels. The latest date for receiving pictures at the galleries is March 9th, 1938.

Owing to the rapid increase in business Messrs. Actina Ltd., formerly of 29, Red Lion Square, High Holborn, W.C.1, have found it necessary to remove to larger and more convenient premises at 19, Woodstock Street, W.1, telephone number Mayfair 6168. The new premises will be equipped with both show-room and demonstration theatre, and we understand that "A.P." readers will be welcome at any time to examine new lines, or to obtain fuller details concerning them.

The Annual Exhibition of the Bournemouth Camera Club, which was announced in our "Week's Meetings" columns as opening on September 13th, has unfortunately had to be postponed until October 25th. There will be three members' classes and three open classes for prints and slides. Silver, bronze medals and diplomas will be awarded, and in addition the Searell Cup will be presented to the member exhibiting the best print (any subject) who has not previously taken an award at any exhibition of the club. Entry forms for this exhibition, which is open from October 25th to October 30th, inclusive, are now ready for distribution, and application for these, which contain full particulars regarding fees and conditions of entry, should be made to The Hon. Secretary, Bournemouth Camera Club, Gervis Hall, Bournemouth. The latest date for receiving prints is October 18th.

Messrs. Zeiss Ikon Ltd. ask us to announce that their address in future will be Maidstone House, 25-27, Berners Street, W.1, and their new telephone number is Museum 8323. From to-day, all letters should be sent to the new address, and telephone calls should be made to the new number.

The City of London and Cripplegate Photographic Society are commencing their winter session and extend a cordial invitation to all who are interested to attend the opening meeting on October 4th, at 6.30 p.m., when Dr. D. A. Spencer, President of the Royal Photographic Society, will deliver a lecture entitled "The Camera Cannot Lie." We would mention that the Hon. Secretary of this

society is Mr. W. E. Ginger, 131, Hampstead Way, Golders Green, N.W.11, who will be pleased to give particulars regarding the club's activities to any who are interested.

We are informed by the Harrow Camera Club that their Hon. Secretary, Mr. C. W. Johnson, has changed his address, and that, in future, all communications should be forwarded to him at 16, Ashburnham Gardens, Harrow.

We have heard that Mr. J. H. L. Adams is leaving Harpenden and that his office as Secretary of the Harpenden and District Photographic Society will be filled by Mr. H. A. Bell, 8, Bloomfield Road, Harpenden.

The Colour-Scoper is a device for viewing miniature colour films or transparencies from ordinary negatives in the 24×36 mm. size. It consists of a frame built to take positives bound between glass plates 5-cm. square, behind which is mounted a ground-glass diffusing screen. This is set far enough away from the plane of the positive to ensure that the grain of the glass shall be completely out of focus, and therefore invisible, when viewing the picture. Mounted on the frame is an achromatic eyepiece, in telescopic

mount for focussing, which gives an image magnified about 2½ times, and so shows details of the transparencies which are too small to be seen by the unaided eye. There is no doubt that

colour positives viewed in this way show up to very good advantage.

Special frames for easy mounting of the films are available, these consist of two glasses and a metal surround into which the film, sandwiched between the glasses, can be slipped in a moment. Cineplast masks, to which the films can be stuck, are also available. These cost 10s. per 100, while the frames sell at 15s. for 25, and the Colour-Scoper itself costs £1 1s. Both are available from dealers, or direct from the agents, Messrs. Sands Hunter and Co. Ltd., 37, Bedford Street, Strand, W.C.2.

The winners in the last two Wallace Heaton "Happy Holiday" competitions are Mr. W. F. C. Holman, 12, Hardwick Road, Eastbourne, Sussex, with his picture entitled "The Well," and Mr. J. L. Gaskel, 47, The Byway, Darlington, with his print "Ice and Rock." Each of the above has been awarded one guinea for his print. Readers will find full particulars regarding these weekly competitions in our advertisement pages.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. The series from No. 1 to 61 included all standard chemical and optical formulæ and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulæ issued by the leading manufacturers of plates, films and papers.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5×3, supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is 5½×3½×3 and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Hife & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

93. Makers' Formulæ : Developers for Gevaert Papers—(3)

G. 261. Warm-Tone Developer.

Sodium sulphite (anhydrous)	350 grs. (40 grm.)
Glycin	54 grs. (6 grm.)
Hydroquinone	54 grs. (6 grm.)
Sodium carbonate (anhydrous)	260 grs. (30 grm.)
Potassium bromide	18 grs. (2 grm.)
Water to	20 oz. (1,000 c.c.)

If crystallised sulphite is used, take double the quantity shown above. If crystallised carbonate is used, take 700 grs. (80 grm.).

The more the developer is diluted, the more red becomes the tone, and the longer the necessary period of development. The exposure required remains unchanged whatever the dilution.

Compared with G. 251, G. 261 requires increased exposure as follows:—

For Clarex and Vindex D Contrasty, 3 times.
For Vindex D Normal and Soft, 6 to 8 times.

Vindex D and Clarex.

With these G. 261 gives brown-black to brown tones in 2 to 3 minutes. For brown to red-brown tones dilute with water to two or three times its volume, and develop for 3 to 7 minutes. For red-brown to red tones, dilute to four or five times its volume and develop for 7 to 10 minutes. All times refer to 65 degrees; at higher temperatures development is faster and the tone redder. Temperatures below 65 degrees must be avoided.

Prestona, Ridax, and Artos.

These give warm-black and brown tones with undiluted G. 261.

Develop Prestona for 1½ to 4 minutes, Ridax and Artos for 1½ to 2½ minutes at 65 degrees.

Diluting the developer prolongs development and yields warmer tones.

For more rapid work, exposures may be reduced if metal is added to the developer. Make up the following solution:—

Metal	180 grs. (20 grm.)
Sodium sulphite (anhydrous)	180 grs. (20 grm.)
Water to	10 oz. (500 c.c.)

From 15 to 75 minutes of this may be added to each 20 oz. of G. 261, allowing reduced exposure but giving tones less red than G. 261 alone.

The addition of metal may also be used to give brown-black prints from hard negatives, which give red tones in a concentrated solution of G. 261. With metal, the following results can be obtained:—

Solution undiluted: Brown-black tones from vigorous negatives.

Diluted to double bulk: Brown-black tones from normal negatives.

Diluted to three to seven times bulk: Brown to red-brown prints.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a *separate* stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Fixing in a Tank.

I have often read that separate dishes should be kept for developer and hypo, and yet it appears to be common practice, if one can judge by advertisements, to fix a film in the tank in which it was developed. Is this really safe?

P. W. (Bushey Heath.)

The danger is that if the glaze of a porcelain dish chips or cracks it uncovers a porous surface into which hypo can find its way and from which it is next to impossible to wash it out. With glass dishes there is no need to keep them to one purpose, as even if chipped the surface remains an impervious one. The same is true of tanks, which are mostly made of moulded material. Either a tank or a glass dish can freely be used for hypo without in any way prejudicing its future for development, as the hypo, not being able to soak in, can all be washed away in a few moments under the tap.

Markings on Negatives.

Recently I have found regular vertical markings on my films—vertical, that is, as the film lies in the tank. On discovering the markings I filtered the developer before the next film, but the streaks appeared again. During development the film was agitated at frequent intervals. Can you tell me the cause of the markings? J. H. W. (Liverpool.)

We cannot say with certainty the cause of the markings on your negatives, but they are so regular that we are fairly sure that they did not arise in the tank through diffusion of unused developer or any such cause as that. The appearances suggest that the film has been in contact with some such material as paper, and that the pattern or watermark has in some way affected the film. This might conceivably occur if the film is old, or has been badly stored in contact with its own backing-paper. We suggest that you send a sample negative, together with the backing-paper if possible, to the makers of the film for their opinion.

A Criticism.

Would you consider the enclosed print approaches competition standard? I only took up photography three weeks ago, and the enclosed is my first attempt at a time exposure.

J. B. P. (Bristol.)

Although the subject has good points, it is not altogether satisfactory pictorially. You do not say whether the print is your own work, but prints made by professionals are only eligible for our Beginners' competition, but, even in this, it is not by any means up to the standard of the prize-winning prints. You can hardly expect to do much in the direction of competition work after only three weeks' experience.

Society's Address.

Having recently moved to this district, with which I am not yet very familiar, I should like to join a photographic society if there is one within a convenient distance. Can you tell me of one?

P. P. M. (Esher.)

We think your nearest camera club is the Kingston Camera Club, the Secretary being Mr. V. W. Banks, 1, Cadogan Road, Surbiton. There is also the Richmond Camera Club—Secretary, Mr. F. H. Howard, Dalkeith, Couchmore Avenue, Esher; and the Windlesham Camera Club—Secretary, Mr. J. C. Hayward, Hallgrove, Bagshot, Surrey.

Yellow Stains on Prints.

When printing on gaslight paper, using a proprietary developer, I sometimes get yellow stains on the enclosed prints. What, please, is the cause of these? T. W. T. (Wakefield.)

The most likely cause of yellow stains is insufficient rinsing between development and fixing, and we should recommend you to use a stop bath instead of plain water. A quarter to half an ounce of metabisulphite—the exact amount is unimportant—in a pint of water will make a satisfactory stop bath.

Another possible cause of stains is the use of an unsuitable developer. Although bromide paper can safely be used with

any good standard developer, the same is not always true of gaslight paper, some brands of which do not work satisfactorily except when used with a developer made up very closely to the maker's formula.

Long-distance Photography.

If a pair of binoculars were placed over the lens of a camera, could distant objects be photographed at large size? If so, how should the binoculars be focussed, and what would be the result on the exposure? G. E. A. (Wimbledon.)

Your plan, we take it, is to focus the binoculars on a distant object and then replace your eye by the camera so as to photograph what the eye sees. For this to be satisfactory you must be able to examine the image on a focussing screen. If you cannot do this you will be working quite in the dark. You would almost certainly find that the binoculars will interfere with the definition of the camera lens, and the necessary exposure would depend entirely on the optical characteristics of the binoculars. All we can tell you with certainty is that the exposure will need to be a good deal longer than with the camera lens by itself.

Depth at Infinity.

I have a camera fitted with a 90-mm. $f/4.5$ lens, and have been working out a depth-of-focus table. What distance should I take for that focussed on when working out the near limit of depth with the camera set at "infinity"?

A. F. A. (West Hartlepool.)

To work out your depth-of-focus table you must have found the hyperfocal distance for each stop. With the camera focussed at "infinity," the nearest plane in focus will be at the hyperfocal distance that appertains to the stop in use.

Renovations.

Is there a suitable preparation (proprietary, if possible) to apply to camera bellows to keep them supple and in good condition? And is there any preparation that will be suitable for doing up a blind shutter that has worn thin?

T. R. H. N. (Hull.)

A firm specialising in various preparations for such purposes as you name is the Vanguard Manufacturing Company, of Maidenhead, Berks. If you write to them they will no doubt tell you what preparations they can supply to suit your needs.

Dry-Mounting.

I have been trying to dry-mount some prints on double-weight paper with the aid of a domestic electric iron, but even though I have pushed the temperature up so far as to perish the tissue, I cannot make the prints stick. Shall I have to get a dry-mounting press? J. B. (Essex.)

It is rather more difficult to mount double-weight prints than single weight, but we cannot understand why you altogether failed to succeed. It is only a question of getting the right temperature through the print to the tissue, and if you have succeeded in over-heating the tissue, it is obvious that you could heat it to the right extent by lowering the temperature. The alternative to buying an expensive machine is to get a quotation for mounting the prints from a company doing such work, such as the Adhesive Dry Mounting Co., Ltd., 27-28, Fetter Lane, London, E.C.4.

an invitation

Messrs. Amateur Cine Service Ltd., request the pleasure of your company to inspect their new London showrooms at 6 Gray's Inn Road, Holborn, W.C.1, where the latest Cine and Miniature photographic apparatus is displayed. You will not be asked to purchase anything.

BRIGHTER PHOTOGRAPHY

By DAVID CHARLES, F.R.P.S.

The carefully arranged chapters cover the whole field from the choosing of a camera to developing and printing the finished picture. Details of the various photographic materials on the market are given, and there are important sections dealing with Focussing, Aiming the Camera, Photographic Groups, Lighting and Exposing.

In addition there are over one hundred and sixty illustrations, each numbered and each conveying a really useful hint.

ORGANISED COLLABORATION INVALUABLE

This same amateur photographer, utilising J.P.D. Services, and under our organised guidance, has earned £80 from his camera during the comparatively short period he has been associated with us. The pictures are taken in spare time only, and he freely admits that before being shown by us how to get the type of human interest pictures Editors crave, *he knew absolutely nothing about either a camera or camera journalism*. Complete credit for his success is unreservedly accorded our Organisation.

VAST MARKET. J.P.D. Photo Services are available to any amateur photographer who genuinely desires to produce saleable pictures in his or her spare time. Some 6,000 British Newspapers, Magazines and Advertisers buy literally hundreds of thousands of photos every year. This fine, permanent market is open to those who **know** what to take, and **How** and **Where** to sell.

We show you **What, How** and **Where** through the medium of our established Fleet Street facilities. You too can emulate the Member's accomplishment described above. No special camera, equipment or previous experience is required.

VALUABLE OFFER. Every amateur photographer should investigate this intensely interesting means of making an otherwise expensive hobby pay for itself. It would give us pleasure to send to you upon request a complimentary copy of our helpful book entitled "Making Money with Your Camera." No obligation on your part, of course. We will also send you full information as to scale of payment for photographs.

SEND US YOUR PHOTOS. You are invited to submit to us a selection of your present photographs, some of which may possess journalistic worth. In any event, we will freely give you our opinion as to their potential value. Call personally, or write, using coupon.

RONDINAX 60 DAYLIGHT DEVELOPING TANK

This tank incorporates many desirable features—the paper backing is removed before the film enters the developer; the film is wound **into** the developer, thus avoiding any risk of air bubbles; both developing and fixing are carried out without opening the tank. Only 4 to 5 oz. developer are required for a full charge, and as the entire developing and fixing operations are carried out in complete darkness the tank is ideal for panchromatic films. It completely eliminates the need for a dark-room. For any roll film $2\frac{1}{2} \times 2\frac{1}{2}$ or $2\frac{1}{2} \times 3\frac{1}{4}$. Price..... £1 13 0

ISOPAN ISS ROLL FILM

Ideal for Autumn and Winter Photography. Speed 31° Scheiner to daylight. Due to high sensitivity to red and yellow the effective speed to artificial light is even greater, making snapshots possible under ordinary lighting.

'The difference is truly amazing'

You may think you are getting the
best results from your negatives,
but are you certain?

Why not remove all doubt by
sending your next order to:

RAINES & CO. (EALING) LTD.
THE STUDIOS EALING, W.5

Read the following extract from
one of the many letters received,
and then send along a small trial
order.

"The enlargements to hand this morning,
for which I thank you.

It is difficult to believe that these pictures
are made from the same negatives as
previous copies which were done locally,
the difference is truly amazing, and you can
be sure that you will have all my work in
future."

RUDY— STARITA

MY CHIEF—

Has always shown me
so much kindness and
consideration, that I,
and those for whom I
am responsible, cannot
help but to pass this on

TO HIS CLIENTS.

Incidentally—come and meet him for yourself,
for sincere and expert advice on "still" or
ciné photography—

ENSIGN

**DAYLIGHT
ENLARGERS**

These "Big Print Makers" are no more difficult to handle than an ordinary printing frame, and the results are incomparably more attractive, particularly from the smaller sizes. There is no focussing. Just put the negative at one end and the bromide paper at the other. Solidly made of seasoned wood, leatherette covered. Holders for negative and bromide paper. Selected achromatic lens and metal plunger shutter.

For Postcard Enlargements from:—

2 1/2 x 1 1/8 in. (V.P.)	15s. 0d.
Half 2 1/2 x 3 1/2 in. (16 on size 20)	15s. 0d.
2 1/2 x 3 1/2 in. (or 3 1/2 square enlargement from 2 1/2 square)	17s. 6d.

For Half-plate Enlargements from:—

2 1/2 x 3 1/2 in. (or 4 1/2 square enlargement from 2 1/2 square)	27s. 6d.
-------------------------------------------------------------------	----------

NEW ENSIGN ALBUMS

**THE
GARRICK**

A Magnificent New Series in 5 colours—Grey, Blue, Red, Green and Brown.

Most luxurious in appearance. Full bound, with padded covers of extra stout material. 25 detachable grey leaves mounted on to coin posts with heavy deep flanges so that nothing protrudes on the cover.

No. 3098. Size 10 x 8 in.	5s. 0d.
No. 3099. Size 12 x 10 in.	7s. 6d.

Complete with colour gift box.

**THE
SELFIX**

The leaves are "wired in" in an entirely novel way which ensures that the album will lie perfectly flat when open. 20 stout rich black art leaves. Covers are extra stout and are faced with bright black reeded rexine.

No. 3088. Size 10 x 8 in.	3s. 6d.
No. 3089. Size 12 x 10 in.	5s. 0d.

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS:—

12 words or less.....2/6
2½d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 28 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 230, Deansgate, Manchester, 3; 26a, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer," when both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged; over £10 and under £50, 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to ILIFFE & SONS LTD., and crossed

& Co.

Notes being untraceable if lost in transit should not be sent as remittances.

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

CAMERAS AND LENSES

SANDS HUNTER'S EXPOSURE NOTE BOOK

Just the right size for your pocket, it is always ready for entries and reference. So printed that you can jot down at once the particulars of each exposure you make—Film, Lens Aperture, Time, Light Conditions, Filter, etc., it forms a valuable record of past work and a sure guide to future success. It is pleasingly bound, slim yet comprehensive.

Price 6d.

Postage 1 1/2d. extra.

BOLEX

POINTS OF SUPERIORITY

WITH MODEL G.3

1 Projects, with equal efficiency, 8 mm., 9.5 mm. and 16 mm. films.

2 Enclosed mechanism, entirely gear driven, not a single belt being used in the whole apparatus.

3 Precision optical system with Calex glass triple condenser and large-aperture lens ensures a remarkable luminosity, giving 165 lumens from 500-w. lamp using mechanism equivalent to a three-blade shutter. The 500-w. lamp is interchangeable with a 250-w. lamp (the latter costing only 21/-) giving a screen luminosity of 110 lumens.

Gate and pressure pads made of stainless steel throughout, minimising wear and ensuring long life to films.

4 2-in. lens fitted as standard. Interchangeable lenses of varying focal lengths are available.

5 All controls conveniently placed on right-hand side of operator. Independent lamp and motor switches.

Model G.3. Other features include: Rapid motor rewind, "still" pictures and "reverse" mechanism. Powerful air cooling. Interchangeable lamps, 500-watt or 250-watt (the latter only costing 21/-). Fitted 2-in. lens and 500-watt lamp, with resistance .. £52 : 10 : 0

Model G.916. As above, but for 9.5 and 16 mm. films..... £45 : 0 : 0

New Model DA.37, for both 9.5 and 16 mm. films. Mechanism equivalent to a three-blade shutter, gives perfect flickerless projection. Fitted 40-mm. lens, with resistance .. £29 : 17 : 6

MANY OTHER MODELS.

Enlarging time is here again and
THE NORSE TRADING CO., LTD.
offer you the finest value in 'Quality'
Enlarging apparatus.

RAJAH ENLARGERS

Of precision design and construction.

F/4.5 anastigmat, one-hand lever rise and fall, with automatic locking. Universal negative carrier provides for the insertion of either strip or single negatives. Helical micro-focussing and orange cap.

Model 0, up to 4×4 cm. negatives, enlarges 2 to 8 times linear, complete with single condenser and with two metal masks for 35-mm. and 3×4 cm. films.

Price..... £8 8 0

Model IIE, up to 6×6 cm. negatives, complete with double condenser and one metal mask 6×6 cm. .. £11 10 0

Model IIIB, up to 6.5×9 cm. negatives, complete with double condenser £15 15 0

GNOME MASKING FRAMES

An indispensable accessory for use with above enlargers. These frames are constructed entirely of heavy gauge metal finished in attractive black crystalline lacquer, the baseboard being white enamelled and graduated in inches.

Gnome Standard, with two adjustable bands and giving a fixed white margin of 3/16ths of an inch.

For all sizes up to 10×8 in. 22s. 6d.
For all sizes up to 12×10 in. 27s. 6d.
For all sizes up to 16×12 in. 49s. 6d.

GNOME DE LUXE

With four adjustable bands, having the special advantage that this can be adjusted to any intermediate distances and will give a uniform white border of any width up to 1½ in.

For all sizes up to 10×8 in. 37s. 6d.
For all sizes up to 12×10 in. 47s. 6d.
For all sizes up to 16×12 in. 82s. 6d.

GNOMATIC STANDARD

An addition to the range of Gnome Masking Frames, the Gnomatic Standard is designed for use with automatic enlargers, and is fitted with two adjustable bands. The frame is constructed entirely of metal in black crystalline lacquer, the adjustable bands being graduated in inches.

For all sizes up to 10×8 in. 29s. 6d.
For all sizes up to 12×10 in. 42s. 6d.
For all sizes up to 16×12 in. 60s. 0d.

GNOMATIC DE LUXE

This frame is also designed for use with automatic enlargers and due to the adjustable top portion of the frame, a white margin may be obtained of any width up to 1½ in.

For all sizes up to 10×8 in. £2 17 6
For all sizes up to 12×10 in. £3 17 6
For all sizes up to 16×12 in. £5 10 0

EXACT Focussing Negative

With very fine engraved dots, lines, etc., for critical focussing of negative in enlargers.

Leica size.....1s. 3d.
2½×2½.....1s. 3d.
2½×3½.....1s. 6d.
½-plate.....2s. 0d.

LEICESTER

Rhaco VIEW-FINDER

The "Rhaco" View-finder has immense advantages over the ordinary direct-vision finder as usually fitted to hand cameras. A large, brilliant image may be seen, precisely as it will appear on the negative, when the camera is held at eye-level. State make of camera when ordering.10/-

Rhaco FINDER MAGNIFIER

The "Rhaco" View-finder Magnifier enables the user of any folding camera fitted with the usual small brilliant reflecting finder to see the image considerably magnified. It can be instantly clipped on to the finder of any small roll-film or plate camera and focussed to suit the sight of the user.

Model I, to fit on reflex finder 1 in. square, or smaller, 6/-

Rhaco LENS HOOD AND FILTER

The "Rhaco" Combined Lens Hood and Filter Holder can be quickly attached to any ordinary lens mount. The Orthoplan Filter is unmounted and can easily be removed when not required, thus allowing of the lens hood being used without the filter.

PRICES:
Model I, to fit lens hood 1 in. to 1 1/2 in. diameter, including Orthoplan green or yellow filter and leather case12s. 6d.
Model II, to fit lens hood 1 in. to 1 1/2 in. diameter13s. 9d.
Model III, to fit lens hood 1 1/2 to 1 3/4 in. diameter18s. 9d.
Obtainable from all Photographic Dealers.

JOIN OUR FILM LIBRARY

We have the finest range of silent and talkie films. All the latest releases are added first to our comprehensive list.

THREE-YEAR GUARANTEE

Everything we sell costing £10 or more is supplied with a printed three-year guarantee—it's just another item in the Wallace Heaton Service.

DEFINITELY THE BEST CINÉ CAMERA BARGAINS ANYWHERE TO-DAY

Compare the prices of this used apparatus with any similar apparatus offered by any firm in England and you will immediately be convinced of its superiority in value. The prices are definitely LOWER by a big percentage—the apparatus, of course, is of the same high standard that has won for us such a fine reputation for good bargains. Choose yours now—you'll get an instrument that will save you pounds, and although used, will give the service of new apparatus costing much more money. Any item costing £10 or more is supplied with a printed three-year guarantee.

We have a splendid range of second-hand accessories for use with these instruments—they are all fully guaranteed, and prices have been cut to the lowest anywhere in the trade. As advertisements on these covers go to press a fortnight in advance some of these second-hand items may be sold already, but similar outfits are usually available.

STRIP PRINTS

from Leica and other 36-exposure 35-mm. negatives.

Wallace Heaton were first as usual with this new method of dealing with miniature films. We make complete strip prints (36 exposures) for 3s. 6d. A photo-electric exposure installation ensures uniformity of results from even widely different negatives. This is the best possible method yet introduced for filing purposes. Strip prints can also be had on transparent film for projection—these cost 5s. per 36 exposures.

NEW AUTOMATIC "ROLLEIFLEX"

With automatic film-wind, which in one action automatically sets the shutter, prevents double or blank exposures, and sets the built-in self-timer for delayed action. Has improved controls, larger aperture finder lens (now f/2.8), giving brighter screen picture. Peep window showing speeds and stops in magnified form. Zeiss Tessar f/3.5 lens and Compur Rapid shutter speeded to 1/500th sec. T. and B. **£31:5:0**

24 monthly payments of 28/-.

SEE IT NOW AT BOND STREET!

WE CAN SUPPLY "AUTOMAX" (Regd.) PRINTS

from Leica, Contax, Retina, etc., enlarged to 3½ x 3½ or 4½ x 3½ for 2s. 6d. a dozen, or from Rolleiflex, Rolleicord, Roloflex and similar size negatives enlarged to 3½ x 3½ for 2s. 6d. a dozen. Get these big-sized prints from your miniature negatives—they're ideal for your album collection.

Negative on Selo Hypersensitive Panchromatic Roll Film—Alpha Filter.

CAPTURE THE GREATER BEAUTY OF TRUE-TO-COLOUR TONES

The photographer who wishes to improve his work will gain much by changing over to SELO Hypersensitive Panchromatic Roll Film.

Fast enough to ensure sparkling negatives from ultra rapid exposures, even when light is poor, SELO Hypersensitive Panchromatic Roll Film responds to the entire colour range and yields pictures remarkable for the beauty and delicacy of their tonal gradation.

Leica AND TRADITION

"Shean Trews," the famous National dance, springs from an age old culture—it is tradition. Scientific evolution has produced the Leica, which embodies all traditional qualities of Leitz apparatus—precision, ingenuity, practicability, besides beauty of form—all of which are reflected in the Leica.

KODAK

NEWS

NIGHT PHOTOGRAPHY with the 3 Kodak aids ★ Fascinating ★ Inexpensive ★ Simple

Get a 'Photoflood' lamp (2/6), a 'Kodaflector' Reflector (3/-), plug in to the mains, and—not forgetting Kodak 'S.S. Pan.' film for your camera—you are all set for this wonderful new pastime of Night Photography indoors—a pastime you can now enjoy with *any* camera, thanks to these wonderful Kodak aids.

Ask your Kodak Dealer for the absorbing, instructive, fully illustrated booklet, 'How to take Pictures at Night.' Or write to Mr. A. P. Taylor, Dept. 57B, Kodak Limited, Kodak House, Kingsway, London, W.C.2.

How this picture was taken: 2 'Photofloods' in 'Kodaflectors'; Kodak S.S. Pan film; f.11; 1 second.

PLEASE MENTION "THE AMATEUR PHOTOGRAPHER" WHEN CORRESPONDING WITH ADVERTISERS.

SEND US YOUR

"NOVELTY" PHOTOGRAPHS

There are no restrictions—Any amateur may enter using any camera or materials he cares to choose. The coupon at the foot of this advertisement must be sent with your entry.

THE MOST FASCINATING COMPETITION OF THE YEAR

Anyone can make unusual and novel pictures—true, it requires a little thought and ingenuity—but that's where the fun comes in. Go about with your eyes open—a hundred possibilities will suggest themselves to you. For instance, a shot taken looking down a lift shaft—or a still-life subject with the shadows only making the picture. Photographs may be taken indoors or out. Unique lighting effects may play a big part in the success of any picture. All entries must have a brief description of the subject matter on the back. There is no entrance fee—now go in and win. The entries will be judged equally on their novelty as well as their photographic quality.

All entries to be judged by Wallace Heaton Ltd., whose decision shall be final. AMATEURS ONLY (Full name, address, title of entry and coupon on back of each entry). ANY MAKE OF CAMERA or MATERIALS. DEVELOPED, PRINTED OR ENLARGED ANYWHERE. ANY SIZE, MOUNTED OR UNMOUNTED (not less than 8×6 unmounted is recommended).

WALLACE HEATON LTD. HAVE THE RIGHT TO PURCHASE THE NEGATIVE AND COPYRIGHT OF ANY PHOTOGRAPH SUBMITTED FOR TWO GUINEAS, OR THE RIGHT OF ONE REPRODUCTION FOR 10/6. (If a guinea prize-winner for an extra guinea.) Copyright of the £25 prize-winning photograph and negative becomes the property of Wallace Heaton Ltd., without further payment.

Prizes are 21/- each week and 6 Certificates of Merit. £25 (Twenty-five pounds) for the best photograph submitted during the competition (13 weeks). If stamped addressed envelope is enclosed every endeavour will be made to return photographs to competitors. No guarantee of safe return can be made, and no entries will be returned unless above is complied with. Acceptance of these rules, etc., is a condition of entry. A selection of the best entries will be held back at the close of the competition for exhibiting in our galleries prior to their return.

Announcing the
introduction of

Criterion
"DE LUXE"

BROMIDE PAPER

Prolonged research has resulted in producing Bromide Paper, in six grades of contrast, which whilst preserving clarity and purity in the whites yields really rich velvety depth—intense depth—in the shadows.

Criterion "De Luxe" Bromide produces, with ease and certainty, prints of that luscious quality of which you dream.

Here is a selection of surfaces:—Smooth Matt, Silky Lustra, Natural Surface, Grained Silky, Silky Rough, all in White and Cream. Also Glossy White.——You try it!

Catalogues upon application.

104-page Catalogue FREE!

"KODASCOPE EE"

With 200-watt lamp, available with choice of six interchangeable lenses, giving projection 40×30 in. pictures from a distance of anything from 9 ft. upwards. Operation is quiet, flickerless and simple. For either A.C. or A.C./D.C. With 1½-in. f/2 lens.

Cash price **£32 : 10 : 0**

24 monthly payments of 29/2.

PATHOSCOPE 200-B

With 200-watt lighting. Pictures 10 ft. wide easily obtainable. Flickerless projection, sprocket fed. Threading one side only. Single nut tilting device. Works off 110 volts. With lamp, plug, flex, adapter and one empty 300-ft. super reel.

Cash price **£15 : 0 : 0**

24 monthly payments of 13/5.

Good exchange allowances

M & W FAM ENLARGER

Fam III for roll films and plates up to 6×6 cm. Double anastigmat f/4.5 9-cm. lens with iris stop, exchangeable against additional lens 5.5-cm. focal length, with manual focussing. Condenser with 100-watt opal lamp. Dual control, rise and fall and fine focussing.

Cash price **£18 : 18 : 0**

24 monthly payments of 17/-.

ENSIGN MAGNAPRINT

It has a removable top fitted with a lamp-holder. Its tubular mounting is very rigid. Fine focussing is carried out by the helioidal lens mount which is provided with a large knob which locks it firmly in position at the required point. Takes half-V.P., Leica and Contax negatives. With f/6.3 lens.

Cash price **£5 : 5 : 0**

15 monthly payments of 7/5.

PLEASE MENTION "THE AMATEUR PHOTOGRAPHER" WHEN CORRESPONDING WITH ADVERTISERS.

THE new Compass Roll-Film Back can be interchanged with the standard hinged back (for glass plates) in a second or two. It holds its own miniature roll-film of 6 exposures—a most convenient number. It has positive one-turn-per-picture winding and a retracting pressure plate. The thickness of the camera is increased only $\frac{1}{4}$ inch. Two types of film are available, Selochrome at $1/6$ for two six-exposure spools and Selo Fine Grain Panchromatic at $1/9$ for two six-exposure spools.

Compass Roll-Film Back £5 · 0 · 0

● WRITE for the 48pp. illustrated Compass booklet. Appointed Compass Dealers will gladly demonstrate the Compass Camera and the new Roll-Film Back.

ORGANISED COLLABORATION INVALUABLE

This same amateur photographer, utilising J.P.D. Services, and under our organised guidance, has earned £80 from his camera during the comparatively short period he has been associated with us. The pictures are taken in spare time only, and he freely admits that before being shown by us how to get the type of human interest pictures Editors crave, he knew absolutely nothing about either a camera or camera journalism. Complete credit for his success is unreservedly accorded to our Organisation.

VAST MARKET. J.P.D. Photo Services are available to any amateur photographer who genuinely desires to produce saleable pictures in his or her spare time. Some 6,000 British Newspapers, Magazines and Advertisers buy literally hundreds of thousands of photos every year. This fine, permanent market is open to those who know what to take and How and Where to sell.

We show you What, How and Where through the medium of our established Fleet Street facilities. You too can emulate the Member's accomplishment described above. No special camera, equipment or previous experience is required.

VALUABLE OFFER. Every amateur photographer should investigate this intensely interesting means of making an otherwise expensive hobby pay for itself. It would give us pleasure to send to you upon request a complimentary copy of our helpful book entitled "Making Money with Your Camera." No obligation on your part, of course. We will also send you full information as to scale of payment for photographs.

SEND US YOUR PHOTOS. You are invited to submit to us a selection of your present photographs, some of which may possess journalistic worth. In any event, we will freely give you our opinion as to their potential value. Call personally, or write, using coupon.

VALUABLE COUPON

Journalistic Photo. Distributors Ltd., Dept. JR,
Ludgate House, Fleet Street, London, E.C.4.

Sirs,—Please send me free and without obligation your fully illustrated book "Making Money with Your Camera," also scale of payment for pictures and particulars of J.P.D. Free-Lance Services. I enclose selection of my snaps; kindly let me know their journalistic rating (cross out latter sentence if not applicable).

TO OVERSEAS AMATEUR PHOTOGRAPHERS.

Your inquiries are cordially invited.

AMATEURS! WHY NOT MAKE PROFESSIONAL ENLARGEMENTS?

YOU CAN BY USING THE
"EXAKT"
 AUTOMATIC
 ENLARGER

Trade workers all over the country are using this simple speedy apparatus. It can be used equally well by the amateur, and bought at an "amateur" price. With the "Exakt" a single enlargement or the biggest batch of work can be carried out with exceptional speed owing to its simple manipulation and perfect construction. The f/4.5 three-cell Steinheil Cassar enlarging lens works smoothly on its spiral mount. A turn of the focussing ring is all that is required to get dead accurate focussing. The "Exakt" is built of solid, reliable cast metal, and will give years of good service.

Made in 3 sizes. For enlarging from all size miniature negatives up to $3\frac{1}{2} \times 2\frac{1}{2}$.

IN STOCK AT ALL GOOD DEALERS.

Have you seen
 this Sensational
 Exposure Meter?

"TEMPIPHOT"

Model T30/100.

Gives accurate readings up
 to eight minutes

For example, at f/9 and 23° Scheiner it has hitherto been possible to measure up to 120 secs. It is now possible up to 480 secs.—8 minutes. For very intense light conditions (for instance the sun shining on snow or strong sunlight on highly light contrasting objects) the instrument possesses a light throttle, which not only functions as a measuring range switch, but also as a means of matching the angle of vision of the meter to that of the majority of cameras. In this way, a greater exactitude in all measurements is naturally obtainable, even under the most difficult lighting conditions. After correct adjustment of the meter the actual exposure reading is given immediately on the scale. Can be used without or with Amplifying

Element which easily plugs into the top of the meter and still further increases its already enormous strength.
 Price of Tempiphot £4 0 0
 Amplifier £1 17 6

Leather zip-fastener cases for either, 5s. 0d.

NOW

is the time for you to decide

whether the films you are making now are going to be worth showing in years to come, or whether, through being shown on a projector of inferior design, they will be so much worn-out junk—just at the time when they will be getting really interesting.

Now is the time for you to decide that scratched and worn film is going to be a thing of the past. At the new reduced prices the Paillard-Bolex range of projector is the finest value on the market, and there is a model in the range to suit YOUR requirements and give you that wonderfully brilliant, flickerless screen performance and absence of film wear for which Paillard-Bolex projectors are famous. You can show your films hundreds of times on a Paillard-Bolex projector without them showing any signs of wear.

Besides the models illustrated below the Paillard-Bolex range includes the following:—

MODEL G.916, same as G.3, but for projecting 9.5 and 16 mm. films. With resistance.....£45 0 0
MODEL G.816, same as G.3, but for projecting 8 and 16 mm. films. With resistance.....£45 0 0

Model G.16, same as G.3, but for projecting 16-mm. films only. With resistance.....£39 0 0
MODEL G.8, same as G.3, but for projecting 8-mm. films only. With resistance.....£39 0 0

PAILLARD-Bolex PROJECTORS

£16:6:6
12 monthly payments of 28/7, 24 of 14/4.

ONLY A FEW NOW LEFT

Over £6 Saved! Brand new, as originally issued by makers. Zeiss Ikon Super Ikonta (Model 530/15)

With famous Zeiss Ikon range-finder, Zeiss Triotar f/4.5 lens, Klio shutter, 1/5th to 1/100th sec., T. and B., and delayed-action, etc. Most attractive size pictures.

Attractive Picture Sizes.

For 8 exposures 4 1/2 x 2 1/4 in. on normal spool, with option of 16 2 1/4 x 2 1/4 by removable mask. Full size is most pleasing shape and generous dimensions; smaller is amply big enough to give good pictures of itself, yet exceedingly economical.

Over £6 saved Listed at **£16:5:0**
WESTMINSTERS PRICE **£9:17:6**
12 monthly payments of 17/4.

SPECIAL CHAMPLIN 15 MICRO-GRAIN DEVELOPER

Now obtainable at the WESTMINSTER IN SOLUTION.

3/9 per 20-oz. bottle.

Excellent Keeping Qualities.
NO increase in exposure.

ROLLEICORD New Popular-Priced Model—Ia.

Gives the usual Rolleicord picture 2 1/4 square (12 on normal 3 1/2 x 2 1/4 spool), and comprises most of the noted Rolleicord features. With f/4.5 Zeiss Triotar anastigmat Compur shutter, 1 to 1/300th sec., T. and B., automatic film winding, metal body with leatherette covering.

£12:10:0
12 monthly payments of 21/11, 24 of 11/-.

Ensign Magnaprint Enlarger

Fitted with friction-drive, rising and falling movement and other features.

Model V/10, for 6 x 6 cm. negatives, f/6.3 Ensar anastigmat **£8:10:0**
12 monthly payments of 14/10.

Model V/11, for 2 1/4 x 3 1/4 negatives, f/6.3 Ensar anastigmat **£9:10:0**
12 monthly payments of 18/7.

Model V/2, for 3 1/4 x 4 1/4 negatives, f/6.3 Ensar anastigmat **£13:10:0**
12 monthly payments of 23/8, 24 of 11/10.

Also with f/4.5 Magnar lenses.

'SPECTO' SUPER 9.5 PROJECTOR

Unique advanced design, quite exceptional performance. Special pre-focus high intensity low voltage lamp. Gearing and driving mechanism running in oil bath. Double-claw movement, motor rewind, speed regulator. Mechanical tilt. Separate lamp switch. Unprecedentedly high luminosity with entire absence of flicker. High efficiency dual cooling.

ONLY **£13:5:0**
12 monthly payments of 23/2, 24 of 11/7.

Transformer for all voltages to 250, 30/- extra.

Resistance for 100 or 250 volts, 35/- extra.

NEW ROLLEIFLEX

In this new model the 6 x 6 cm. ROLLEIFLEX for 12 pictures on usual 3 1/2 x 2 1/4 spool becomes more than ever automatic, revealing a still higher standard of optical and mechanical perfection. Only one action is now needed to (1) set the shutter; (2) safeguard against either blank or double exposures; (3) to give delayed action. There are also, amongst other improvements, new controls for shutter speeds and lens apertures, with magnified readings. The reflex hood is fitted with larger magnifier, and there is a double magnifier and additional mirror for eye-level use. Lens is f/3.5 Tessar, with Compur Rapid shutter speeded to 1/600th sec.

PRICE **£31:5:0**
12 monthly payments of 54/8, 24 of 27/4.

The Key to Success!

ILFORD LUSTRE BROMIDE *for ENLARGING*

To preserve the fine detail in enlargements from miniature negatives Ilford Limited have introduced Lustre Bromide—in several attractive surfaces. This exquisite paper, with its inherent brilliance and the soft beauty of its lustrous surfaces, brings out all the fine detail of the original negative and is eminently suitable for exhibition purposes.

For enlargements from miniature negatives the following three surfaces are especially suitable:—

- SMOOTH LUSTRE
- FINE GRAIN LUSTRE
- CREAM FINE GRAIN LUSTRE

For broad effects the following are recommended:—

- GRAINED LUSTRE
- ROUGH LUSTRE

And for extremely broad effects—

- CREAM EXTRA ROUGH LUSTRE

Vol. LXXXIV. No. 2552

FULL particulars of "The A.P." Annual Lantern-Slide Competition will be found on another page in this issue. The entries in this popular event show a steady increase in number in each succeeding year, and the quality of the slides has become better and better. To be included in the prize-winning set of "A.P." slides is regarded in many quarters as the high-water mark to be reached by any slide-maker. We look forward to a good entry again this year, and already the bookings for the autumn and winter tour are very heavy. The prize set will start on its travels throughout the country in mid-November and finish about the end of the following May. Hon. Secretaries who wish to include "The A.P." Prize Slides in their programmes, and have not already written, should do so without delay, giving as many alternative dates as possible. This is to enable us to fix the itinerary to the best advantage to each society. In the meantime the rules of the Competition should be observed carefully, and the sending-in date—November 1st—noted.

Do Exhibitions Discourage?

"Do exhibitions like the present London Salon of Photography have a discouraging effect on the ordinary amateur?" That is the question asked recently by a reader, who goes on to say: "Here is an exhibition of four hundred works, the best of their kind, many of them by men who have given a lifetime of energy and skill to the expression of themselves in pictorial photography. Here is work from all over the world by people who have been very fortunate in their opportunities

TOPICS of the Week

THE AUTUMN SKY.

See article, "Clouds in Landscapes," in this issue.

for subject-matter as well as having genius to see the subject where it lurks and to portray it, people who understand effects of lighting and composition, whereas most of us can only enjoy them and cannot create or seize them when created. The ordinary person with a camera cannot hope to come within a thousand miles of such work. Does he, therefore, give up in despair? Does he lay down his tools, and say that as he cannot produce a masterpiece which may be hung in the London Salon and priced from five to twenty guineas he will produce nothing?" We think not. After all, the mass of camera users are not so much attracted by the pictorial values which exercise the critics as by the constant suggestion of new subjects and new treatments with which such an exhibition is full. The exhibitions, if they go to see them, may not only inspire them to better work, but may suggest new methods of employing the camera to their own satisfaction and the enjoyment of their friends. So far from discouraging photography among the general population, exhibitions stimulate it.

Last Days of the Shows.

Readers are reminded that the Exhibitions of the Royal Photographic Society and the London Salon of Photography close this week. The last day for both shows is Saturday, October 9th. Those who have not yet seen these two fine exhibitions should hasten to do so before it is too late. The R.P.S. is at 35, Russell Square, W.C., and is open from 10 a.m. to 9 p.m. The London Salon is at 5a, Pall Mall East (near Trafalgar Square), and is open from 10 a.m. to 6 p.m.

News Reels.

The news cinema idea is extending on the Continent. A correspondent who went to a performance the other evening in a continental capital got a startling impression of the martial character of nearly all the pictures. Mussolini spoke to his answering legions, and so did Hitler. Italy, Germany and other European countries simply bristled with armament. Apparently the means of destruction, with occasional diversions into militaristic sport, are the only things considered worthy of

pictorial record. Then the fighting in Spain unrolled itself before the audience, and the ghastly horrors of the war in China. And so country after country passed across the screen, until it came to these little islands of ours, and what the film showed in them was a representation of the King and Queen in simple, hearty, bonny Scotland. The exhibition was one calculated to quicken the patriotism of an exile and to make him think that this country of England—beg pardon, Great Britain—was the best worth living in the

whole world. The popular interest which surrounds the Royal Family may be deemed excessive by some superior people, but in a world apparently becoming dehumanised they do stand for something human, gracious and picturesque. Somehow, we believe that the quiet comeliness of Britain will remain to be loved and pictured when the machine-like tramping of continental armies becomes only a dying echo. We are thankful, at all events, that the British news-reel is more variegated in its effect.

"The Amateur Photographer" EXPOSURE TABLE—October

EVERY MONTH a brief exposure table will be provided for the assistance of our readers in their practical work. A glance at the current approximate exposures as here given will serve as a reliable guide for most purposes. The following exposures will serve as a working guide for any fine day during the month, between the hours of 10 in the morning and 2 in the afternoon, with the sun shining, but not necessarily on the subject. Stop used, f/8. The exposure should be doubled if the sun is obscured, or if stop f/11 is used. For f/16 give four times the exposure. For f/5.6 give half. From 9 to 10 a.m. or from 2 to 3 p.m. double these exposures. From 8 to 9 a.m. or from 3 to 4 p.m., give treble or more.

SUBJECT.	Ultra-Rapid.	Extra-Rapid.	Rapid.	Medium.	Ordinary.	Slow and Process.
Open seascapes and cloud studies	1/350 sec.	1/250 sec.	1/150 sec.	1/75 sec.	1/30 sec.	1/20 sec.
Open landscapes with no very heavy shadows in foreground, shipping studies or seascapes with rocks, beach scenes	1/200 "	1/150 "	1/75 "	1/30 "	1/15 "	1/10 "
Ordinary landscapes with not too much foliage, open river scenery, figure studies in the open, light buildings, wet street scenes	1/100 "	1/75 "	1/40 "	1/20 "	1/8 "	1/5 "
Landscapes in fog or mist, or with strong foreground, well-lighted street scenes	1/75 "	1/40 "	1/20 "	1/10 "	1/5 "	1/2 "
Buildings or trees occupying greater portion of picture	1/25 "	1/10 "	1/6 "	1/4 "	1/2 "	1 "
Portraits or groups taken out of doors, not too much shut in by buildings	1/10 "	1/5 "	1/3 "	3/4 "	1 1/2 "	3 secs.
Portraits in well-lighted room, light surroundings, big window, white reflector	1/4 "	1/2 "	1 "	2 secs.	4 secs.	8 "

As a further guide we append a list of some of the best-known makes of plates and films on the market. They have been divided into groups, which approximately indicate the speeds referred to above.

SOME POINTS for Lantern-Slide Makers

The following article deals with some of the points which should have attention from lantern-slide makers. Many otherwise good slides are spoiled by lack of attention to small details. Our readers who are preparing entries for "The A.P." Annual Lantern-Slide Competition should make a note of these points.

THE lantern slide has been well described as the best means of showing the quality of a good photograph, while, it may also be added, it is one which is very unkind to defective negatives. It is also true to say that many slides are made from good negatives which are unsatisfactory when projected, through lack of attention to some of the essential details in preparation.

The Negative.

While it is realised that only perfect negatives make perfect slides, it is very necessary for the lantern plate to be suited to the contrast of the negative. This is a point which often escapes attention. The photographer favours a certain grade of lantern plate, and expects it to be satisfactory with negatives of all kinds of different contrasts and densities.

The range of the lantern plate is wide, but it must be one that is suited to the negative, in the same way that one grade of bromide paper is not suited to all negatives. For example, the chloro-bromide plate requires a negative of greater vigour than that of the black-and-white variety, and while it is possible to make slides upon these plates from thin negatives, the colours are never as fine.

Density.

One of the most important points to consider is the density of the slide. The best slides, examined in the hand, will be found to be quite thin, the image being hardly more than a deep stain. There should be no clear glass, even the highest lights must have some hint of deposit, and the shadows must not be so opaque that no light passes through. As a rough-and-ready test, the slide may be placed upon a page of clear print, and it should be just possible to read through the deep shadows.

Slides by Contact or Projection ?

It is often debated whether the best slides are made by contact or projection. If the subject is crowded upon the negative, and especially if the

latter is of larger size, reduction is called for. It is of advantage to get the subject of suitable scale for a lantern plate. For example, a flower subject or a portrait should be on a larger scale than a landscape. In these days of very small negatives most people will enlarge up to two or three diameters. When making slides by projection the negative should be masked and the lantern plate supported upon a black surface (black velvet is good for the purpose) instead of the white of the enlarging board. This will assist in preserving purity of tone values, these often being lost through reflected light from the back.

Colours.

It is possible to make lantern slides in a great range of colours, and this leads the less experienced worker to misuse the power. Most subjects look best in a warm black or cool sepia tone, and "hot" colours should be avoided. It often happens that the colours which are secured by increased exposure and restrained development lose considerable quality in the high-lights.

Care needs to be taken in the use of colour toners and stains, for while these are useful in providing variety in a set of slides they are only effective for occasional use, and for certain subjects. Indigo blue for seascapes, dark green for landscapes, etc. Care must be taken not to have these colours too intense, a suggestion of colour is all that is necessary. Hand-coloured slides should be avoided unless the worker is an experienced artist and very expert in applying the tints.

The Picture on the Slide.

Care should be taken to place the picture central on the slide, and to keep the horizon line level. It is possible to put this right when projecting, but often the operator does not notice the fault. While the slide is intended for viewing on the screen, there is no excuse for having the one-sided appearance which occurs when the picture is more to one side than another or nearer to the bottom

than to the top. A very annoying defect from the point of view of the audience is for one picture to appear near to the top of the screen and the next at the bottom.

Many slides, especially those made by projection, have light corners, through lack of proper attention to the adjustment of the illuminant.

Spotting.

Provided that the negative is free from pinholes, or that these have been carefully touched out, there should be no need for spotting of defects on the slide. Obviously, care in the dark-room in avoiding dust and a dust-free negative will do much to avoid the need for spotting. If the slide has many pinholes the best course is to make another.

Many slides are spoiled by bad spotting. One mistake is the use of opaque water-colour. A transparent colour such as is used for colouring prints is preferable. A finely-pointed brush is very necessary, and the inexperienced worker will do well to put in some preliminary practice upon wasted plates before attempting work on a good slide. Most workers make the mistake of doing too much spotting, and the result is to make the defect more obvious than before.

Other Matters.

Care should be taken with regard to masking and binding the slides. It must be remembered that masking is equivalent to trimming, and will assist in the presentation of the subject to the best advantage. The corners of rectangular masks should be square; if they are not a slovenly effect is given to the picture on the screen. Fancy shapes, such as domes, cushions, and rounded corners should be avoided. Clean glass should be used for covering, a point that some workers seem to overlook.

A final point. The film, of the slide, and the cover-glass must be perfectly dry before binding up. If moisture is sealed up between the two, it will have a harmful effect in the heat of the projection lantern.

Clouds in

By C. C. ROLLINSON

Wind on the Hill.

ONE would hardly think that in these days of colour-sensitive emulsions there would still be great difficulty experienced in obtaining landscapes with a well-graduated sky or satisfactory clouds. Yet it is so, and blank white skies still seem to occur regularly with many amateur snapshots. The trouble is to get a truthful rendering of the landscape, and, at the same time, clouds that are printable. The correct exposure for the foreground would, on an average, be something like ten times that required for the sky, so the matter resolves itself into a compromise in the use of adaptable material and of particular technique in developing and printing.

Spring and autumn are the best periods for clouds, and it behoves those photographers who are still in the beginner stage to obtain some understanding of the special factors for securing good clouds in landscape negatives. To use an ordinary film or plate is to court dense, unprintable skies, because the blue of the sky acts on the emulsion with much greater intensity than do the tones and colour of the landscape. In the many "chrome" films now available the emulsion sen-

sitivity extends to green and partly to yellow; in panchromatic material this sensitivity is further extended to red. By the use of these materials the greens, yellows and, in panchromatic, the reds, in landscape can be correctly rendered. By the further use of a colour filter on the lens the blue of the sky is modified and the emulsion does not respond to it quite so readily as it otherwise would, while the greens are admitted freely. Chrome emulsion, with a filter, enables one to register clouds and obtain tone in the blue of the sky. Better, perhaps, is panchromatic, which because of its extended colour sensitivity, and by reason of its high speed, will often enable a good sky to be obtained without the use of a filter. A filter having a factor of 2 to 2½ to 'chrome and 1½ to 2 to panchromatic is the best for practical landscape. A K1 or Alpha can be recommended.

The question may be asked as to what is the best time of the day for clouds. This query can only be answered by reference to the nature of the photograph desired; if pure landscape with clouds as adjuncts to the composition, consideration must be given to the

The Wind-swept Sand Dunes.

October 6th, 1937

Landscapes

AN AUTUMN SUBJECT FOR THE OUTDOOR AMATEUR.

important. In this class we would include sunrise and sunset, when many beautiful effects can be obtained. In practice the best landscapes are obtained some time before or some time after the sun has reached its zenith; in early morning or late evening the general illumination of the foreground is usually very effective pictorially, but calls for an exposure which would be far too long for the sky. The best results for both seem to be obtained in mid-afternoon.

The latitude of modern panchromatic material is very wide, and using a $2\times$ filter twice normal exposure for the foreground should be given; it is quite

A view in Bucks.

Ready for Sowing.

unnecessary to curtail this exposure out of any fear that it would be too much for the sky. Actually it is too much, but the blue has been restrained and the emulsion latitude and the control which can be exercised in developing and printing will assist in balancing the total effect. The use of a meter is recommended to get correct exposure.

To minimise the range of tones as much as possible, the use of a dilute developer is recommended. This has the effect of building up the shadows without clogging the high-lights, and development should be stopped just when the high-lights would be printable on a normal bromide paper. The time should therefore be cut down by at least one-third of that recommended for the particular developer. In practice, I find that if I have a luminous sky with a heavy foreground the best negative is obtained by tank development 1 in 100 (Azol) at 65 degrees, half the scheduled time. The negative will be on the soft side, but this is to the good for enlarging.

In pictures where the clouds form the chief interest, the foreground should bear some relation to the theme or mood conveyed by the sky. For instance, in "Wind on the Hill" and "The Wind-swept Sand Dunes," the foregrounds were carefully chosen to be attuned to the sky mood. Imagine

each picture remade with the sky belonging to the other, and the importance of this choice at once becomes evident. Although it is often considered a great merit if a photograph includes any clouds at all, yet my concluding advice to serious photographers seeking cloud pictures is that, even as clouds introduced into a picture primarily a landscape should fall into the general scheme of the composition without creating a competitive note, so should a foreground used secondarily to a cloud composition be in harmony with the mood conveyed by the sky.

The Country Road in Winter.

Readers' Hints, Tips and Gadgets

HAIRPINS IN THE DARK-ROOM.

FIG 1.—Although this title might suggest a clue in a detective yarn, that is not the purpose here. In spite of their supposed obsolescence, hairpins are obtainable in penny bundles at any draper's or large store, and can be put to a number of photographic uses, as the illustrations show. With the aid of a pair of pliers make a short bend at the tips, then another about half-way along; finally pull the "legs" slightly apart. These three operations are shown in that order.

Fig. 2.—The result is a hanger which will carry, without causing any marks, a length of miniature negatives, when the processed film is required to be dried. Stood on a table or shelf the same gadget will accommodate with equal safety any glass negative from Compass size up to 5×4 for the same purpose. This wire bracket is equally convenient for those who like to stand small mounted prints, or unmounted postcards, on their mantelpiece.

DAVID CHARLES.

A LENS-CHANGING SCHEME.

A BATTERY of interchangeable lenses for cameras of the larger sizes usually means a corresponding number of special lens-flanges and adapters; items which are sometimes difficult to get, and costly if specially made. But for cameras possessing wooden lens-panels—such as single-lens reflexes and some hand stand models—the following scheme is simple and very flexible.

The illustration shows the main idea. It consists of extra lens-panels which clamp to the front of the camera when the normal lens is removed. Four holes, one in each corner of a panel, coincide with four headless bolts fixed into the wooden front of the camera. The panels, made of sheet aluminium 3/32nds in. thick, are secured in position by milled nuts (wireless terminal tops). Each lens has its own panel, to which it is fixed by the threaded ring supplied with most lenses.

The illustration shows a lens-panel in position on the front of a camera, and it will be noticed in this case that the lens ring is soldered to a second small panel (brass) mounted behind the main one, and secured by three bolts. This was done to recess the lens a little, as the thickness of the main panel did not allow it to focus to infinity. Constructional measurements are not given because they will vary with different cameras; and, the scheme being simple, the illustration is almost self-explanatory to the handyman with tools. **F. GANDON.**

REMOVING THE CURL FROM PRINTS.

SMALL prints, especially those made on single-weight paper, have an annoying habit of curling up while drying, and usual methods, pressing the prints, or stroking the backs with a ruler, take time. Here is a quicker method requiring only a few minutes to carry out. Before laying the prints out to dry, the superfluous water should be removed with clean blotting-paper to ensure even drying. When dry, the prints are ironed, preferably with an electric iron, as follows.

Switch the current on for about two minutes to make the iron moderately hot. If the iron is too hot the heat may affect the gelatine. A safe working temperature can be found by trial with a discarded print. Soak a wad of cotton-wool in

water and squeeze it nearly dry. Stroke the back of the print with the cotton-wool to make it slightly damp, and lay it face downwards on a non-fluffy ironing cloth. A clean linen dish-towel, folded twice, will serve the purpose. Iron the back of the print lightly with a side-to-side motion, and after removing the iron do not lift the print but leave it on the cloth for about fifteen seconds. If this is done, the back of the print starts to curl upwards and counteracts the natural tendency of the print to curl in the opposite direction. The quickest way is to leave the print on the cloth while the next print is being dampened.

I have found this method particularly useful when dealing with batches of prints up to quarter-plate size. Larger prints can also be ironed with advantage, but usually require pressing as well.

S. H. MILLAR.

Longer Exposures up to 1 second from the hand at eye-level . . .

Now that the days for indoor and longer exposures are approaching, the vibrationless focal-plane shutter on the Ensign Multex will be found invaluable. It is particularly free from shock on the accurate "geared down" slow speeds and exposures of as long as 1 second can be made from the hand with perfect ease. The audible operation of the shutter is of great assistance in helping the operator to keep the camera rigid during exposure.

With the All - British Precision Miniature

ENSIGN MULTEX

- Wide Base Range Finder, coupled to lens automatically focussing down to 21 inches.
- Takes 14 pictures $1\frac{1}{8} \times 1\frac{1}{4}$ in. (3×4 cm.) on size 27 film instead of the usual 36 pictures on cine film. Size 27 film is more easily obtainable, and gives larger negative area.
- Coupled Shutter Setting and film winding—no double exposures.
- Focal-plane Shutter—slow speeds 1 sec. to 1/15th; fast speeds 1/25th to 1/1,000th.
- Automatic Exposure Counter automatically resets when exposed film is removed.
- All-Enclosed Optical View-Finder.
- Fitted with Automatic Film Pressure Device, released when winding.
- Weight 23 oz. (lighter than usual miniatures).

SUPER IKONTA $2\frac{1}{4}'' \times 1\frac{3}{4}''$

Do you know what this is?

The illustration shows at the back the wonderful direct-vision view-finder devised by Van Albada fitted to the Super Ikonta. Sharp white boundary lines (not shown in illustration) appear projected on the subject itself and enable the composition of even fast moving subjects to be watched with ease. And focussing is the work of a moment, thanks to the accuracy of the rotating wedge distance meter—the wedges of which and the arm holding them are shown at the front of the illustration.

The Super Ikonta is equipped with rapid Zeiss Tessars and Compur rapid or Compur normal shutters, shutter release on the camera body and some models have also interlocking arrangement of film wind and shutter release to prevent unintentional double exposures. The Super Ikonta is made in the following sizes:—

16 pictures $2\frac{1}{4}'' \times 1\frac{3}{4}''$ on the usual $3\frac{1}{4}'' \times 2\frac{1}{4}''$ spool. 8 pictures $3\frac{1}{4}'' \times 2\frac{1}{4}''$ or 16 divided $2\frac{1}{4}'' \times 1\frac{3}{4}''$.
11 pictures $2\frac{1}{4}'' \times 2\frac{1}{4}''$ on the usual $3\frac{1}{4}'' \times 2\frac{1}{4}''$ spool. 8 pictures $4\frac{1}{2}'' \times 2\frac{1}{4}''$ or 16 divided $2\frac{1}{2}'' \times 2\frac{1}{8}''$

SUPER IKONTA

All Super Ikonta cameras sold in Great Britain and Ireland at current listed prices carry the written three-year guarantee. Ask your dealer for particulars. Our interesting book "Miniature Camera Advantages with Large Size Pictures", describes the Super Ikonta series. Write for a copy.

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

In a Printing Works By H. W. PICKERING

THE GALLEY RACK.

SOME time ago I was asked to try my hand at making some interior shots of a large newspaper and printing works, the results to be used as illustrations in a supplement to a local weekly paper. I regard it as rather rash to give a definite answer to such a request as that until I have seen what difficulties

are likely to arise, so the first step was to make a tour of inspection.

The various departments to be photographed were in nearly all cases lighted by daylight from one side only, this being supplemented by fairly bright electric light on the other side. The total volume of light, while quite enough for the people engaged at the place to work by, was decidedly small by photographic standards, and the use of any really large apertures (even if I had possessed an ultra-

A MODERN "COMP" AT WORK

fast lens) would have been ruled out by the evident need for great depth of focus.

Undoubtedly a job for a miniature, so I decided to use my Ikoflex 1, a 6×6 cm. twin-lens reflex fitted with a lens of maximum aperture f/6.3. Even at full aperture, snapshot exposures were obviously impossible, so I took along a wooden tripod to avoid having to rely on being able to improvise a support at the time.

The only illuminants used for the whole set, which amounted to more than forty pictures, were a few electric lights and such daylight as the weather saw fit to provide. In some cases this came from windows at one side of the building and in others only from a skylight about four feet square, while in the press-room itself, which was underground, I had to rely entirely on the artificial lighting. No flash-

"FLAT-BED" PRINTING.

bulbs or flash-powder were used.

The exposures given ranged from 5 to 10 seconds, at apertures from f/6.3 to f/11 according to the depth of focus needed for the various subjects. The workmen who were used for models—and were, of course, deliberately posed—did not seem to find it difficult to keep still for exposures of this length. The film used was fast orthochromatic (Agfa Isochrom) and if panchromatic material had been used the exposures could probably have been shortened a little in view of the fact that so large a proportion of the light was artificial.

THE LINOTYPE WORKER

PRINTING ON ROTARY MACHINES.

Negative Modification and the Miniature By E. NEWTON SMITH.

Fig. 1. Direct enlargement from untouched negative. Note pole and figures in distance behind the head, and white lines on ground at right.

HAVING seen the first prints from their collection of holiday negatives, many photographers are now turning their attention to finding how they can make the best possible enlargements from just a few of the selected best. Being holiday negatives, most were probably taken on the spur of the moment, without preparation, so that many will doubtless suffer from the inclusion of unwanted backgrounds, irrelevant figures, and all the other oddments that, though they hardly blemish a mere snapshot, can quite spoil a picture.

An Indirect Method.

One of the favourite objections of the diehards to the use of the miniature camera is that retouching of the negative is not possible and that therefore modification of the image can be made only by separate work on each individual print. There is, of course, a foundation of truth in this assertion, for a pinhole in a 35-millimetre negative may well obliterate the whole of a face, but the excellence of modern films combined with the now normal routine of filtration of all solutions used in the development of miniature films has almost entirely removed this bugbear of the old-time worker. Nevertheless, there are occasions when modification of the negative is desirable, and whilst the critics are right in saying that work on a small negative is not feasible, there is an alternative method of achieving the same end. Moreover, this method is actually easier and more successful in some instances than the older one of direct work on the negative in that it permits a greater degree of control.

First of all, a straight enlargement on

glossy paper should be made; half-plate is quite a convenient size for the purpose. With very little skill this enlargement may be retouched.

Working-up the Print.

Light areas can be darkened with water colour (lamp black or even blue-black ink mixed with a little gum), or pencil. If the latter is used, a little retouching medium should first be applied to give "tooth" to the paper. Local reduction with "Farmer's" will lighten the tone where necessary, and when the enlargement has been altered to the worker's satisfaction the next step may be taken. The fact that the retouching is painfully obvious does not matter in the least provided relative light values are matched. At this stage the blacked-out telegraph pole in the illustration stuck out a mile, as the saying goes, but in the finished product it is impossible to detect it.

Copying.

All that is now necessary is to rephotograph the modified enlargement, and the negative thus produced will yield a print free from the blemishes (pictorial or photographic) which marred the original. Almost any film will serve for the copy negative, although a slow emulsion is preferable. The enlargement can be pinned or stuck on to a vertical surface (a wall will do) and a 100-watt lamp held just behind and above the camera. On any medium-speed fine-grain film about 30 to 45 seconds at $f/32$ should give a satisfactory negative. This small aperture gives the maximum depth of focus which is so necessary when doing copying work, and even so the focussing must be very critical. Possession of a camera capable of focussing down to 18 or 21 in. is necessarily assumed,

and unless you have an instrument with a ground-glass screen (not twin-lens reflex) you will need to allow for parallax. One other hint on copying in this manner may save you a wasted piece of film—keep the light moving. If you stand it in one position the glossy paper of the enlargement will most likely catch a reflection which will show as a fog-patch on the new negative.

Other Applications.

This method of modifying negatives may be extended in other ways that will readily suggest themselves. Printing-in of clouds on the first enlargement and local overprinting by means of a cut-out mask held over the easel are two which leap to the mind.

Fig. 2. Print from copy-negative. Observe absence of the disturbing details so prominent in Fig. 1.

REDUCING MINIATURE NEGATIVES.

A RECENT issue of a German periodical contains a suggestion for reducing miniature negatives. Where a strip of 35-mm. film has to be reduced a tank is practically essential, if only as a means of handling the film without damaging it, but by rolling it up in an apron it becomes impossible to watch the action of the reducer as closely as is usually desirable.

To get over this difficulty, and also to ensure completely even action, a very slow-acting reducer is suggested. The solution consists of 5 oz. of hypo in 20 oz. of water, to which is added 100

grs. of potassium iodide (hypo 125 grm., water 500 c.c., and add 5 grm. potassium iodide). Reduction begins to be perceptible after the negatives have been immersed for half an hour or so, and it may need five hours or more to remove serious fog. The gelatine is not softened by this long immersion, as the solution appears to have a slight hardening action. Since the reducer itself contains hypo, it is evident that the usual insistence upon complete and thorough washing is not necessary for the process, but if a film has been dried it should be well soaked before reducing. *Fotografische Rundschau.*

Modern Miniature Cameras

THE BABY SPEED REFLEX.

IN style of construction the Baby Speed Reflex, taking pictures 4.5×6 cm., is a miniature version of a full-sized reflex camera of standard pattern. Compared with an ordinary quarter-plate boxform reflex its dimensions are very small, its size when closed being $4\frac{1}{2} \times 4\frac{1}{2} \times 5\frac{1}{2}$ in. over all projections and its weight, complete with lens, 38 oz.

The camera is a single-lens reflex with all movements, including rising front and long extension, associated with this type of camera in the larger sizes. The lens normally fitted is a Dallmeyer Pentac of maximum aperture $f/2.9$, fitted in a sunk mount in such a way that the front component is practically flush with the front of the camera. It is protected when the camera is closed by a dished metal flap, covered in leather and hinged at its upper edge so that when open it forms a sky-shade. The lens is readily removed simply by unscrewing it from its flange, and can be replaced by a Dallon tele-anastigmat of aperture $f/5.6$.

Both this and the Pentac have focal lengths rather longer than is usual for the size of plate used, the focal length of the Dallon being 9 in.,

and that of the Pentac 4 in. In the case of the latter lens at least the larger image, and the more distant viewpoint it enforces, must be regarded as a very considerable advantage for the majority of subjects, whether these be of the pictorial or the snapshot class. The usual 6×6 cm. twin-lens reflex, although it takes a larger picture, has a lens of focal length only about 3 in., giving a very wide-angle view in comparison with the camera under review.

The Baby Speed Reflex is fitted for 4.5×6 cm. plates, which are carried in metal book-form double slides, but film packs of the same size can equally well be used. A revolving back is provided, enabling the plate to be held either horizontally or vertically; there is no need, as with some cameras, to turn the instrument on its side for taking upright pictures.

Focussing is by rack and pinion, the whole front of the camera moving forward bodily. The extension provided is sufficient to allow of focussing on objects as close as 12 in. from the lens.

Points of Interest.

The hood is of leather and is very deep, excluding all extraneous light and enabling the image on the top screen to be viewed in real comfort, even when the lens is stopped down. Since the image on the screen is that actually used for making the negative, the effect of stopping down can be seen on the screen, and does not have to be deduced from a depth-of-focus table. Magnifiers to enable the finest focussing to be done can be obtained to fit the hood.

The shutter is of the self-capping focal-plane type, running at a distance of only about 9 mm. from the actual focal plane. It provides a complete range of instantaneous speeds from $1/10$ th to $1/800$ th sec. as well as Time and Bulb. The speeds have to be set before the shutter is wound. The mirror is spring-raised and requires to be set after each exposure. Mirror and shutter are released by a slight backward pressure on a plunger conveniently placed on the right-hand side of the camera, and provision is made for fitting a wire release for time exposures.

The movement of the shutter is smooth and quiet, and does not jar the camera in the least. There seems to be no doubt that exposures of $1/10$ th sec. could be safely given after a little practice with the camera in the hand. To minimise any chance of shake at such a low speed the mirror can if desired be released before the shutter; a pressure on the release plunger with a restraining thumb on the winding-knob of the shutter sends up the mirror while holding the shutter still, and this can then be fired by a second pressure.

The Baby Speed Reflex, which is a beautifully made instrument, is priced, complete with 4-in. $f/2.9$ Pentac and 3 double slides, at £33. The 9-in. $f/5.6$ Dallon, mounted to screw straight into the Pentac flange, costs £11 extra. Camera and accessories may be obtained through any dealer, or direct from Messrs. J. H. Dallmeyer Ltd., 31, Mortimer Street, W.1.

Miniature Camera Gossip

By LANCELOT VINING.

WILL readers please refrain from writing to me for the formula of the developer I am experimenting with? I shall keep my promise to divulge the secret when I am satisfied I have something of proved interest. For the past two weeks I have been using Metol-Meritol, but am returning to my new blend for further experiments this week; if in the future I decide to publish what I have been doing, it must only be taken as a basis on which interested photographers can make their own tests. So many of the letters I receive seem to indicate that the writers are not at all fond of testing things for themselves, but want to have everything cut and dried. And then they are nearly always the first to turn and bawl you out if anything is spoilt.

New Arrival.

An early-morning demand by the postman for 10s. 4d. announced the arrival of my Kalart Speed-Flash. I have had many queries as to the cost of this lamp; add the above amount to the cheque for £3 5s. I sent with my order and you have it.

You will see by the illustration that the outfit is quite small and unobtrusive, whilst there seems to be very little to go wrong.

A member of the Kalart firm is at present in London. I had a very interesting talk with him, and he expects that the users of the lamp here will become as interested in "Synchro-Sunlight" photography as the Americans have. I will try and have one of these pictures ready for publication next week.

So far I have only been able to test for synchronisation, and my five expo-

THE KALART SPEED-FLASH ON A CONTAX.

sures of $1/50$ th, $1/100$ th, $1/250$ th, $1/500$ th and $1/1,250$ th are perfect. But this does not mean that I am never going to have a failure when I run up against a lagging lamp.

"The Beauty Circus."

This show, produced at Grosvenor House during the very early hours of the 24th September, provided another hour for some "against the light" exposures, and on the whole I obtained a very satisfactory film. A lens expert, who saw it the following day, told me he was frankly amazed at the way the Sonnar $f/1.5$ stood up against the light without giving flare even at full aperture.

The success of the pony picture depended on being able to get the man's head to just cover the spotlight, and I had to alter my position a number of times before it was possible.

This photograph is worth close inspection regarding the depth of focus and definition; my point of focus was on the thin black braid on the uniform. I find focussing against the light very difficult, as the glare seems to dazzle the eye and kill the detail.

THE BEAUTY CIRCUS AT GROSVENOR HOUSE. $F/1.5$, $1/50$ th sec. I.S.S. film.

TEN GUINEAS AND UNDER

A Section for the User of the
Inexpensive Miniature.

With a Miniature in Lakeland

By ERIC JONES.

FOR the second year in succession it has been my good fortune to visit the English Lakes and surrounding district.

A miniature and a bicycle make a perfect combination, for with a bicycle the speed, or lack of it, lends itself to a fuller appreciation of the beautiful country one is passing through. The inexpensive miniature, being light and compact, can be pocketed and forgotten until required.

When contemplating a tour of the Lake District, it is wise to prepare for any kind of weather. On my first visit, I saw Nature in one of her

SUNSET ON DERWENTWATER.

THE END OF THE DAY.

vilest moods—just rain, rain and more rain. However, undaunted by this experience, I tried again this year. What a difference! The same week, just a year later, glorious sunshine, not a drop of rain. It was transformed from a dull, wet, disappointing tour to a veritable paradise for the photographer.

It is a good plan always to carry more spools than you think you will require, for the country simply abounds with pictorial possibilities. Personally I used fast panchromatic stock exclusively with a graduated filter, obtaining first-class results.

A point to guard against when using so fast a film in open, mountainous country

in bright sunshine is over-exposure, and it is a very sound precaution to use an exposure meter. Another tip is to use a lens hood for all subjects, and especially when photographing the lakes or running streams.

It is often very useful to introduce a figure, cattle, a boat or something of the sort into the foreground in order to give proportion to the mountains. A delayed-action shutter is helpful here, and was used for "The End of the Day."

The amateur whose aspirations lie in the direction of sunsets could not choose a better or more varied field for his operations than the English Lake country.

DERWENTWATER FROM KESWICK.

ULLSWATER—AND HOW WE GOT THERE.

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

IN A CINEMA.

I have permission to take some photographs of the screen in the local cinema, but have no idea what exposure to give. My maximum aperture is f/3.5.

R. B. S. (Newcastle-upon-Tyne.)

No definite exposure can be suggested in the case you mention, as so much depends on the power of the light in the projector and the density of the film being shown. If you use the full aperture of your lens and the slowest exposure you think sufficiently safe to avoid movement of the image, you are not likely to over-expose, even using the fastest panchromatic film.

FRONT-LENS FOCUSING.

I have been told that front-lens focussing is not as satisfactory as the system in which the whole lens is moved forward, and that in the former system the full optical efficiency is not retained at large apertures. Is this true?

J. A. M. (London.)

The fact that some of the most eminent camera and lens makers have adopted front-lens focussing convinces us that, provided the lens is designed for this use and that no attempt is made to give a focussing range down to, say, one foot, the method is in no way detrimental to the actual performance of the lens.

DEVELOPMENT FOR SOFT NEGATIVES.

Could you recommend a really soft-gradation fine-grain developer for use with Isopan F film? I have been using Meritol, and find that even with a 50 per cent reduction in development time negatives on 35-mm. film are still very contrasty.

T. S. H. (Boscombe.)

We have found Meritol a perfectly satisfactory developer with the new Agfa F film, provided the development time is sufficiently reduced. In our experience a development time of 8 minutes at 65 degrees is sufficient, and with this period of development we think you will get sufficiently soft negatives to suit your purpose.

BLUE MARKS ON LENS.

On the lens of my miniature there are several small spots, each of which is a purplish iridescent discoloration. Do they affect the performance of the lens, and, if so, how can I remove them? Ordinary lens-cleaning fluid has no effect.

T. H. (Toronto.)

The marks on your lens are due to slight deterioration of the glass, caused by chemical changes on the extreme surface. Marks such as this are quite common, and, unless of considerable extent or density, are not harmful. They can only be removed by returning the lens to its makers to be repolished.

BUFFERED BORAX DEVELOPER.

Can you tell me the correct development time for Isopan F and Zeiss Ikon Panchrom films, using buffered borax developer (D76 plus 14 gm. per litre of boric acid)?

A. H. G. (London.)

As the correct development time depends on the grade of paper you use and upon the contrasts of the subject as well as on temperature, developer and film, we cannot be very definite in giving development times for the films you mention.

As a suggestion for a first trial, we would advise you to give the new Isopan F film about ten minutes, and the Zeiss Ikon Panchrom film about fourteen minutes in a buffered borax developer at 65 degrees.

We do not recommend development at a lower temperature than this, and for equivalent times for higher temperatures we would refer you to Page 588 of our issue of June 2nd last.

GERMAN AND ENGLISH STOPS.

On my miniature camera (a Leica) the stops are marked f/3.5, 4.5, 6.3, 9, 12.5, 18, whereas my exposure meter only gives f/4, 5.6, 8, 11, 16, 22. How can I use the readings given by the meter when it does not give the right stop-values for the camera?

F. O. (Cardiff.)

As we have often pointed out in our pages, the relative values of stops are found by squaring the f/ numbers. The exposure required at f/9 is therefore 81/64ths of that needed at f/8.

In practice, the difference is too small to matter, and you may give at f/6.3 or f/4.5 the exposures the meter indicates as correct for f/5.6 or f/4. If you wish to be more exact, take the speed-number (Scheiner or DIN) of your film as one less than the rated value, which will exactly make up for the slight difference.

how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CDVI.

Mr. ARNOLD
LONGMAN.

From information communicated to our Special Representative.

"MY work lies in portraiture, and is mostly done under studio conditions, and with a wide variety of subject—men, women, children; beautiful, ugly, nondescript. Exhibition pictures emerge, infrequently, from my daily work and efforts. I tell myself that the paucity of results of the necessary interest, quality and distinction for exhibition use is due to the fewness of suitable sitters of required distinction; more probably it is due to my own failure to see and capture what is there. Like Mr. A. R. Elliott, in the issue of September 8th, I have 'evolved no formula to make certain of success.' No one has.

"I use, of course, a reflex—whole-plate or quarter-plate; the former usually with a single, soft-focus lens; the latter with a rapid Zeiss. I work by daylight when it is good, with half-watt (Matéluxe or Nitrachot) at all other times. I prefer the most rapid plates (never films), always backed; sometimes panchromatic, but more often not; as with most complexions, eyes and lips the panchromatic over-corrects. All development is with Azol in a tank.

"For enlarging I use mercury-vapour light entirely; sometimes a soft-focus lens, sometimes diffusion by means of ninon, more often undiffused. Mercury-vapour light gives a far more rounded, less grainy, and altogether better quality image than ordinary electric light with a condenser. At least that is my own experience.

"So much for methods. Ideals? Mainly, to avoid getting into a rut; to deal as far as possible with each subject *de novo*, and not by rule of thumb; and, chiefly, never to be satisfied with a print of less good quality than the negative will yield. This question of *standard* is the most important, and the most difficult; the fatal thing is to be easily satisfied. We must have our own 'gold standard,' and never allow it to be debased. Among a good many other factors, exhibitions like those in Pall Mall East and Russell Square help towards this; they show us both what to aim for, and how not to do it!"

(A further example of Mr. Longman's work is reproduced on one of the centre Art pages.)

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"FULL STEAM," by Shirley T. High.

AN admirable impression of power and a fine expression of dignity are prominent features of this excellent representation of an engine and train in motion. It is a very forceful picture, and is notable, in the first instance, as an illustration of a sound selection of the precise moment of time for making the exposure, and, in the second, on account of its able arrangement and utilisation of the suggestion of line in imparting the characteristics in question.

With a subject of this kind, where the main element—the engine and train—is in motion, the success or failure of the impression depends entirely on the choice of the psychological moment for making the exposure. On this moment depends the placing of the engine in relation to the rest of the picture; the securing of it at a moment when it is belching forth smoke and steam; and the retention of the sensation of movement.

And that it was well chosen is evident from the success the picture achieves. As far as the position of the engine is concerned, it falls athwart one of the strong points of a picture—one of the intersections formed by vertical and horizontal divisions of thirds—and from this fact it derives sufficient importance to maintain its significance as the centre of interest. Its proximity, too, stresses its dominance, and, with so forceful a principal element, the acceptability of the composition is assured. The probability is, however, that the precise position was not determined until the final print came to be made and that it was decided upon at leisure after a careful consideration of the whole of the material embraced by the negative—the presumption being that there was an appreciable margin.

Be that as it may, the placing of the engine with its forepart so near the bottom corner has not a little to

do with the feeling of movement that is so well conveyed, and this impression is heightened by the directional impulse suggested by the inclination of the slanting lines of its body and the train behind. The slant of the rails on each side emphasises the suggestion, and yet a further accentuation is afforded by the backward trend of the wisps of steam on the right-hand side.

The sense of dignity arises from the presence of another directional impulse which is provided by the prominent vertical of the smoke from the engine's funnel. Rising from almost the base of the picture to the top, it creates a very strong impression, and its curve away to the right in the upper part of the print prevents it from imparting a static feeling, as it might if its perpendicular tendency were unrelieved. The influence of line and the sense of its direction have a powerful effect upon the mood of a picture. A predominance of horizontals

helps to suggest an impression of peace and quietude; verticals, as will have been gathered from my preceding remarks, convey a feeling of height or dignity or a state of absence of movement according to their proportion or their relation to the material of which the subject is composed; and lines on the slant have the power of suggesting movement or the exercise of force.

Here, the majority of the lines are inclined, and, to my mind, the feeling of motion, in consequence, is stronger than any other. The suggestion persists, despite the fact that, from the way the smoke is rising and the sluggish manner in which the steam emerges towards the rear, I am bound to infer that the movement cannot have been very rapid and that the engine was either just starting or slowing down.

In such circumstances, I feel that the impression has been very well contrived and that the work, in this respect, achieves a very high standard indeed.

But, on the other hand, I am by no means so favourably impressed either with the way the smoke and steam are represented, with the somewhat gloomy weather conditions, or with the quality of the print. The subject, in all probability, is represented more or less as it was, but I do think that it would have been much more pleasing had it been found possible to

incorporate an effect of sunshine.

It might be said, of course, that the impression of atmospheric mist provides an alternative mood, but I do not feel that it carries the same appeal, and, in connection with the print, it seems to me to have that greyish tendency or degraded appearance that arises from over-exposure and a curtailment of the proper time of development. It might possibly be occasioned by a lack of contrast in the negative and a measure of over-printing, but the former seems more probable.

PICTURES by Novices

*SOME CRITICAL COMMENTS on
the Beginners' prints reproduced on the opposite page.*

THIS "new angle" stunt is getting old. It did have a novelty at one time and a not inconsiderable following. Nowadays, however, it is seldom employed by the master of photography, and then not for its own sake but as a feature that is more or less incidental to quite another theme, which, in nine cases out of ten, would not be so well presented from the normal point of view.

Intention and the Viewpoint.

This view is confirmed by the collection of prints on view at the current exhibition of the London Salon of Photography, at 5a, Pall Mall East, where, although there may be a number of pictures which have been taken from a high viewpoint, none of them rely on that alone for their appeal.

Their subjects are not essentially scenes from abnormal viewpoints with no other motive, but rather a motive that could only be so expressed. The intention is to convey an idea, and to do it properly, a departure from the normal point of view has been enforced. And it all rests upon the intention. With these examples at the show, the intention is pretty well clear, but, with some of the beginners' prints on the opposite page, it is not apparent, and, with all the goodwill in the world, I cannot help but think that the intention has been simply to obtain an example of an unusual point of view or to imitate something of a similar nature that has been seen elsewhere.

To take the case of No. 1, "Sunshine," by Thomas Dalby, as an example, the sunshine is there, no doubt, but, having regard to the nature of the subject, I should say that it could be just as well expressed from a viewpoint down below.

Crazy Perspective.

And, if this be admitted, the reason for the adoption of the high viewpoint immediately becomes invalid. Besides this, it involves a very serious disadvantage in the craziness of the perspective, all the lines which should be vertical being shown as converging towards the base and conveying the impression that the buildings—or parts of them, at any rate—are inclined towards the viewer.

If, on the other hand, my assumption concerning the intention is wrong and the choice of viewpoint was secondary to the sunshine motive, I still feel that it was ill-advised, chiefly on the ground that that motive is more or less obscured by the means adopted to secure it, or, put in another way, the distortion of the perspective claims so much of the attention that the sunlight does not tell as well as it would without that added confusion.

With No. 5, "The Toilers," by C. A. Reader, a corresponding distortion is to be seen in the exaggerated foreshortening of the figures and horse, but the absence of leaning verticals enables the work to avoid the chief objection to the other, and, on the whole, it could, I think, be tolerated.

New and Old.

But the looking-down point of view, besides the foreshortening, has the effect of seeming to dwarf the scale of the subject material, just as though we were looking at the representation of a model of a horse and cart instead of the real thing.

This, naturally enough, is something of a drawback, but whether the viewpoint is justified or not depends on what might have been included if the scene had been taken from a normal standpoint. It is possible that the high viewpoint has enabled the subject to be better isolated, and that the adoption of the lower would have meant the inclusion of much unnecessary material outside the scope of the present range of vision. If so, no other defence is needed, but, were I dealing with such a subject myself and had to choose the higher point of view, I think I should have tried to avoid the inclusion of the second figure in the rear, or see that he were placed a bit farther back, for, as he stands, he seems to convey the unfortunate impression of growing out of the head of the other.

The new viewpoint in No. 4, "Candelabra," by S. G. Pursey, is manifested in the opposite direction, the line of sight being directed upwards instead of down, but, unless the subject can be regarded as qualifying as a "still life," there does not seem much reason for its perpetration. Possibly something might be done with the material if a more extended

use of the shadows could be incorporated, but this, apparently, would be a difficult matter to contrive.

Technique and the Print.

The quality of the print, however, is good, and, from the technical standpoint, it offers no occasion for criticism. A reversion to the normal everyday viewpoint is to be seen in No. 3, "A Hollow Tree," by Charles Colles, and, in a collection of oddities, one turns to it with a certain amount of relief.

There is a hint in the expression of the child on the right that his attention is divided between the game and the sensation of being photographed—an impression that the rendering would be better without—but the other figure is nicely caught and seems to carry out the idea extremely well. It is a pity about the one on the right, but it would be possible to utilise the figure on the left alone, the print being trimmed so as just to exclude the other.

In the case of No. 2, "The Sign Writer," by H. Haydon, the viewpoint is appreciably above the level of the figure but not sufficiently so to introduce any suggestion of distortion. I do not, however, care for the way the framework has been included in the foreground, for it does no more than provide an unnecessary obstruction, and, being out of focus, offers nothing but an ill-defined distraction. The position of the figure, too, is too far over to the right, and, in the circumstances, I may perhaps be forgiven for suggesting that too much attention is given to the sign and not enough to the writer!

Misguided Ingenuity.

There is too much misguided ingenuity about it to allow it to do what it sets out to do in a proper workmanlike fashion, but No. 6, "The Mohamed Ali Mosque," by R. H. Myles, even if its interest is more topical than pictorial, does achieve its aim and sets forth its material clearly and well.

Technically, it is excellent, but, possibly on account of a circumscribed viewpoint, it seems somewhat restricted, and a greater proportion of setting would not come amiss.

"MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE
LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

APPROPRIATE TREATMENT OF SUBJECTS.—II.

I AM adding a few more notes to those of last week on the treatment of subjects, in particular and in general.

The illustrations I used last week required, as I pointed out, no special consideration as regards selection and arrangement; but, more often than not, these matters are of the greatest importance.

The subject of Fig. 1—the Air Force Memorial on the Embankment—is a case in point. It is difficult, as I found when I tried once before. There is practically no room for dodging at the same time the wall on the right and the trees on the left.

On this occasion I was using the subject as a test for the

accuracy of a special view-finder; but I should have been glad at the same time to secure a good record of the Memorial. Lighting and sky were promising, and I liked the leaf shadows on the pedestal; but I could not get the subject into the picture-space. There is too little foreground, and the wing-tips of the eagle are cut off. It answered my purpose admirably as a test, but the result pictorially is only a might-have-been.

This raises the question as to whether we ought to take a subject at all when we know beforehand that the treatment cannot be really satisfactory. There is no definite answer. There are cases in which we are justified in making the best of what we can get; there are other cases in which we should let the subject go, rather than perpetrate an unsatisfactory rendering.

In the case in question I should have been safe with a lens of somewhat shorter focus, but I will not go into this point now, as I hope to do a short series of articles, at intervals, on the lens in practice, and this matter will naturally arise. For the present, suffice it to say that no treatment of a subject is satisfactory if the material is crowded and cramped in the picture-space; and it is still less so if parts of the picture are cut out altogether by the boundary lines.

Another point in treatment is the character of the surface of the paper—glossy, semi-glossy, matt, rough, very rough, silk, linen or canvas grained, and so on. Most of them, perhaps all of them, are appropriate in their place, but the trouble is to decide when each one is suitable, and when it is not.

A highly-glazed surface is right for reproduction purposes, but it has been condemned for "pictorial" purposes. If the print is to be shown under glass there is no objection to this surface, and some of the finest exhibition prints to-day are on such papers. Very coarse-grained or rough surfaces are unsuitable for most small prints, especially if they are to be examined in the hand. A side light emphasises the irregularity of the surface. It may safely be said in a general way that no surface is appropriate if it attracts attention, to the detriment of the picture itself. We may be mildly interested in the surface if we care to examine it, but it certainly should not be obtrusive, aggressive and irritating.

The same thing applies to the tint of the paper base. White may be best, or it may not. Certain cream and ivory tints are often a great aid to a realistic and harmonious result, especially if the image itself is more or less warm in tone. White is generally preferable for snow subjects and high-key pictures; but various light tints of cream have a wide range of usefulness. A safe test again is that the colour of the paper shall not force itself into notice.

Still more demanding careful consideration is the colour of the image itself; and here again the various shades of black are more generally appropriate than any others.

Fig. 1.

It was formerly popular to present certain styles of portraits in Bartalozzi red, following the lead of drawings in red chalk; but photographs in this style were rarely very satisfactory.

Still less justifiable is the presentation of a print in such colours as Prussian blue, emerald green and even (alas!) mauve and magenta, lemon yellow and pink. The excuse was that such colours were more "realistic" for certain subjects. A seascape in Prussian blue was more "natural."

Such an excuse was a bad one. If a print was to be in monochrome there was no justification for making it in the "prevailing colour." In most subjects there is no such thing as a definite prevailing colour, although there may be prevailing colours.

In the subject of Fig. 2 the most general colours are greens; but greens in great variety. If the print is made in one green colour it does not help us to realise all the colours in the subject, but actually hinders us. In a black-and-white print we can easily make a mental picture of the approximate colours of the roofs, chimneys, steps, and so on. But it is more difficult to think of the tiles as red if they are thrust before us as a vivid green. Once again, then, the appropriate colour of the image is one that allows us to consider the subject of the picture without being compelled to notice its colour.

I have not, of course, dealt with all the matters that arise in the best treatment for all the many and varied

Fig. 2.

subjects we photograph, but I think I have mentioned the most important, and they are surely enough to go on with. The great point to keep in mind is that "the picture's the thing"; and we should be able to look at it without being distracted by anything outside it.

W. L. F. W.

"The Modern Encyclopedia of Photography"

PHOTOGRAPHIC reference books, as distinct from textbooks, are not at all numerous, and even the one or two that are available make their appeal rather to the expert in search of a formula than to the ordinary photographer in search of more general information. It is precisely this gap that "The Modern Encyclopedia of Photography" has set out to fill, and it does so without in the least reducing its value to the expert.

The Encyclopedia is being published in a series of weekly parts, the second of which was released yesterday. Each part, consisting of some sixty-four excellently-printed and very fully illustrated pages, is priced at one shilling. When complete, the whole will make three handsome volumes, and will be rounded off with a large general index.

The arrangement of the work is alphabetical, which is by far the best and simplest plan upon which to build any book that will be called upon to produce information on any desired subject at a moment's notice. All too often, however, a too-strictly alphabetical arrangement leads to a scrappy volume, quite unreadable as a whole, and in which closely related subjects are widely separated if they happen to fall under different letters of the alphabet.

In "The Modern Encyclopedia" this drawback has been ingeniously avoided by the use of a system of Group Headings. Under each of these there is an article, or series of articles, upon the topic in

question, bringing together in their proper relationship the facts, formulae, and methods that would otherwise be scattered about in the form of a number of minor entries.

Replacing many scattered references by one comprehensive article in this way has the further advantage that this Encyclopedia, unlike most other volumes bearing that name, is as interesting to read straight through as any ordinary magazine would be. Each article is, of course, complete in itself and fully illustrated, and deals in an authoritative manner with its subject.

The list of contributors is an impressive one, including nearly all the best-known names in the photographic world. One or more articles, dealing with subjects on which they are acknowledged as authorities, have been written by each of these contributors. The list includes experts in all branches of photography, both technical and pictorial, and does not exclude those of eminence as professional portrait photographers or in press or natural-history work. With so much knowledge and experience at his service, any reader of the Encyclopedia is certain to find in it a vast body of information of great value to him, and that he would find it difficult or even impossible to obtain elsewhere.

The Encyclopedia is edited by Mr. S. G. Blaxland Stubbs, who is the General Editor of Waverley Technical Encyclopedias, in conjunction with Mr. F. J. Mortimer, Editor of *The Amateur Photo-*

grapher, and Mr. Gordon S. Malthouse, Editor of *The Amateur Ciné World*. The two latter also figure in the list of contributors, and the first part contains an introductory article by each, Mr. Mortimer writing on "The Triumphs of Modern Photography," and Mr. Malthouse on "Modern Magic of the Amateur Ciné Camera."

In the first part, too, there is announced a competition open to all who subscribe to the complete Encyclopedia. Entries are to be in two divisions, the one for amateur and the other for professional photographers. The division for amateurs is in five sections—for indoor photographs, portraits, landscapes, snapshots and miniature camera work respectively—and in each section the prize offered for the best print is £25, with second and third prizes of £5 and £2. In addition, there will be a hundred monthly prizes of £1 and 10s. for the best entry in each of these sections that is received during each month.

Any reader who is anxious to possess a comprehensive book dealing with photography in all its phases, and so arranged as to provide ready reference to any desired piece of information, would do well to add "The Modern Encyclopedia of Photography" to his bookshelf. It can be obtained through any bookstall or newsagent, or by direct subscription from the publishers, The Amalgamated Press, Ltd., The Fleetway House, Farringdon Street, London, E.C.4.

MAKING BETTER SNAPSHOTS-18

By DAVID CHARLES.

This article is the eighteenth of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

Fig. 1. A bald record like this may serve to recall past incidents to the photographer, but is most dull for anyone who did not share those incidents.

"THAT," said my friend Parslow, "is the antique-shop where I bought Ethel her Ming vase. Do wait while I take a snapshot of it." So I waited.

I had heard all about that vase. Whether genuine or not, they had coveted it, and had scraped to buy it. That shop served to bring to Parslow's mind all the details of that particular episode in his career; his wife's cajoling, his own economies in tobacco and similar necessities of masculine life, and the eventual purchase and careful conveyance to their home of the precious possession.

Fig. 3. Here the lighting and the shadows assume almost as much importance as the subject itself. Barring special associations, most people prefer it to be so.

But what, to you and to me, does that snapshot of his convey? Nothing at all! There it is, in Fig. 1. Just a shop. But Parslow is visibly offended when he shows that snapshot around and finds not a flicker of interest to greet it. You see, his interest in that shop is emotional. Seeing the shop, or the picture of it, certain emotions are aroused in his mind. But not in yours or in mine.

Now the interest in any

friends too." Grudgingly he came. "Do you notice," I asked him, "the old-fashioned look of the buildings opposite? I'm sure they must be older than the shop itself. Let us see if they can be included in the picture to give it atmosphere." Parslow began to be interested. He remarked that the passing clouds might help to fill the sky-space, and that passers-by might indicate that others besides himself were interested in the shop. So he hastily caught them while they were there, so producing Fig. 2.

Fig. 2. The surroundings help to convey "character" as much as the subject itself. But though the lighting is interesting, and the figures help, the car is rather out of place.

photograph ever taken, if there is any interest at all, is an emotional one. If those emotions are private and individual ones, like Parslow's, the photograph won't arouse any emotions in other people, unless they can see in the photograph something that appeals to *their* emotions. This appeal is often quite indefinite. It need not be that they can see, for instance, in such a shop-photograph as this the absolute details of the contents. The very expression "antique-shop" is, in this case, the idea or emotion which the photograph should convey.

I explained all this to Parslow, but he was still pained. "That is an antique-shop," said he. "You can't make it any more of a shop, and you can't make it any more antique-looking than it is. To me it is a very interesting antique-shop." "To you," I rejoined, "it is a photograph of a very interesting antique-shop. Let us see whether we can make a photograph of it which will interest your

He did not notice that the light was dimmed by those same clouds, nor that the passers-by were rather confused against a standing car, the latter itself scarcely in keeping with the sentiment to be portrayed. But when the sun came from behind the clouds, and cast a shadow pattern through the windows and over the roadway we were standing on, Parslow certainly began to lose his air of bored scepticism. "What a charming effect," said he. "Do you think we could catch it?" "Try," I said. So he tried, with

Fig. 4. Another version of the shop and its surroundings, the latter now being shown as reflections in the shop window

Fig. 3 as the very satisfactory result.

"Before we go back," I then remarked, "take a glance at those reflections of clouds in the window, and the peculiar outline of the window-frame around them." "It does look rather fascinating," admitted Parslow, as he carefully aimed his camera.

And that is why Parslow's friends are beginning to find his photographs interesting.

Moonlight Effects

By IAN BALL.

AS most photographers know, true moonlight pictures are very seldom seen, and no one would attempt to take pictures by moonlight except as experiments, but it is a fairly easy matter for any amateur to be able to make pictures with moonlight effects by the simple methods outlined below, the underlying principle being to under-expose and subsequently to overprint.

1/50th sec., f/45. Selochrome. No filter. 4.30 p.m.

1/100th sec., f/16. Selo Fine Grain Panchromatic. Micro 5 filter. 6.30 p.m.

The ideal film to use is panchromatic in conjunction with an orange filter—for example the Ilford Micro 5, which has a factor of about 4, and which gives the hard empty shadows characteristic of moonlight. This filter can be obtained in gelatine form for a few pence. Exposures vary with the make of film and filter used, but as a guide 1/100th second at f/16 with Selo Fine Grain Panchromatic film and an Ilford Micro 5 filter would be about correct. An exposure of 1/100th of a second at f/32 on the same film but without a filter would give you nearly as good a result. If a 'chrome film is used, the filter must be dispensed with.

The best results are obtained in the early morning or in the late afternoon, photographing against the light with the sun making a long reflected lane on the sea. A strong foreground, human or otherwise, is essential.

Choose a cloudless day, as any clouds are liable to come out too white if an orange filter is used. Use a lens hood and make sure that no direct sun shines into the lens. This can be done by moving until the sun is behind some object in the picture, such as the mast in the print herewith, or by making something outside the picture itself cast a shadow across the camera. The deck above on a ship would do admirably, or a friend could be asked to hold his hat in the required position, making sure that this does not appear in the negative.

SUGAR-COATED GASLIGHT PAPER.

AMATEURS who use gaslight papers often find it difficult to remove the print from the developing dish at the right second. The trouble is that these papers develop so quickly that considerable skill and manual dexterity are called for. Critical control of depth of tone is not really possible when the image flashes up in a few seconds. Further dilution of the developer with water, or restraining the action with bromide, results in prints of a bad colour.

By making use of ordinary white granulated sugar the time of development can be lengthened. It will be appreciated that if with the normal developer the time of development is 30 seconds, and with sugar added to the working solution the time is doubled, there is a much greater degree of control. When sugar is added as a retarding agent the tone-quality of the print remains the same as when normal quick-working developer is used, and the same number of prints may be made from a given amount of solution.

The developer should preferably be one of the metol-hydroquinone variety. Amidol also answers well. Make up the developer for use in the usual manner, and to each 4 oz. of the solution add one teaspoonful of granulated sugar. Stir well until dissolved.

This is the most generally useful dilution. It will be found to double the developing time and to give prints of perfect black-and-white tone. Taking this as a standard, variations may be made to suit individual preferences or circumstances, but two teaspoonfuls of sugar to 4 oz. of working solution should be regarded as the limit for good black-and-white print quality. When properly dissolved in the solution the sugar seems to form a sugar-coating over the emulsion, holding up the penetration of the developer. It does not, however, check or in any other way affect the action of the fixing solution, and may therefore be relied upon not to affect the permanence of the prints.

S. W. JARVIS.

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Amateur Cinematography

The Importance of the "Climax"

By
D. CHARLES OTTLEY.

IT is hardly necessary to tell the ciné amateur what an important thing is the climax to a film. If he has studied professional productions he will have noticed how each sequence contributes to the establishment of a set of circumstances which bear directly upon and lead up to a *dénouement* or climax. It is like a number of railway lines coming from all directions to a common source or junction. Upon its climax is a story for filmic treatment judged and many professional scenarists evolve their plots around a pre-determined climax chosen solely on account of its cinematic possibilities. Unless a story possesses a real hundred-per-cent "kick" somewhere round about the last page its chances of acceptance by a film-producing company are negligible.

The Amateur's Failing.

A fair number of amateur ciné societies aim at producing at least one story film per annum, and it is significant in the majority of cases that everything comes up to scratch except the story. The trouble does not lie in the shortage of suitable plots nor in a dearth of quite good ideas from the cinematic viewpoint. The common stumbling-block seems to be an ignorance of those essentials that produce that last-minute heart palpitation which sends the spectator home fired with the conviction that what he has just witnessed is stupendous and far and away better than anything he has seen before or is likely to see again.

The Even Tempo.

It would not be right to say that climax is essential to every film, but it would be a fairly accurate statement if one said that a film that drives home its points and sets the spectator thinking *without* a climax is as near to being a *great* film as anything we know to date. "Rembrandt," in the sensational sense, was a film without a climax, and duly paid the penalty at the hands of the "fan" fraternity. To the few disciples of the shadow who have troubled to prove the new and vital possibilities of cinema it is likely to remain a classic. The Saul sequence, for example, held every nerve tense, but it was rather the ear that was hypnotised by the intoxicating beauty of Laughton's diction than the eye by the practically static screen picture. It is easy for the student to follow Korda's technique, but for the mass the lack of accelerated tempo in the form of accentuated screen action (usually associated with the conventional screen climax) proved too

much. Even the critics commented upon *lack* of purpose in the general development of the story . . . so why blame the mob?

In Sound or Pictures.

The presentment of a film's climax may be threefold. It can be done pictorially by the screen, or orally by the sound-track, or it can be a combination of both. Some readers may recall the colossal fire sequence that brought Fritz Lang's "Saga of the Nibelungs" to its magnificent finish, or the hair-breadth motor chases in the Mabusa films. These are concrete examples of the pictorial climax at its best. In Korda's "Things to Come" the climax was verbal, against a background of stars, not, as many imagined, the sequences leading up to the gun-firing episode. A recent Russian talkie finished upon a snort of disgust by a workman "all dressed up and nothing particular to do," misjudging the distance of his "spit" and landing it upon his immaculately polished shoes. The first version of the German film "Dreaming Lips" developed its climax against the washing ebb and flow of a river while a voice gave details of a dead

girl found therein. "Hungarian Legend" (that exquisite French production featuring Annabella) ended upon a bucket of water being emptied out of Heaven by a mother anxious for the welfare of her child upon the earth below. The climax to "Green Pastures" was a smile—radiant, challenging, agonisingly happy, triumphant. "Remous" reached its maximum tension upon a shot of an empty corridor and its climax was the report of a revolver.

The Climax in Documentaries.

Most documentary films worthy of the name achieve a climax scarcely less arresting than some of those already mentioned. Grierson's "Sone of Ceylon" wound up upon a native dance the tempo of which increased in barbaric fury until the spectator was in a state of mental upheaval. Rotha's "Contact" (a story of flying) made use of a caption intercut word by word against an advancing plane, each word increasing in size as it flashed upon the screen.

So should the amateur consider the possibilities of the *climax* and from this work back to the smallest points likely to be of use in landing it with telling force in the midst of his audience.

A sunny Autumn morning in the Park—especially on Sundays, will provide a scene full of interest, movement and variety for the amateur ciné worker in search of topical subjects.

Safeguarding Your Photofloods By "COMPUR."

OWING to the "overrunning" method adopted with Photofloods and all other lamps working on a similar principle, the life of their filaments cannot be compared with that of the familiar bulbs used in ordinary illumination. Yet the advantages of "overrunning" technique are so overwhelming that very few amateurs can afford to neglect them.

There are, however, both sensible and harsh ways of using the lamps; and only through sensible treatment can the filaments be made to yield the maximum degree of satisfaction.

Thoughtless Waste.

Now, unless the camera is running throughout the whole time during which a lamp is fully burning, wastage is obviously certain to occur. In other words, the life of the filament is being frittered away with no compensating balance of film exposures.

Yet many amateurs are guilty of focussing, adjusting and making various other arrangements with their lamps blazing away at full intensity. When questioned on the matter, they almost invariably reply to the effect that they must have lights to see what they are doing—though one or two say they cannot get the shadows "just

right" unless they have the lamps on.

Usually, however, any old lights will suffice to let us see exactly what we are doing . . . but, because the shadows are important, it must be conceded that best results nearly always follow a careful try-out with the actual lamps in filming position. Even so, it does not necessarily follow that the lamps must be burning at full consumption.

And, because of this, the amateur should use his overrun lamps only in conjunction with a series resistance.

Suitable Resistances.

The popular Photofloods and other lamps, being made in two ranges to cover the familiar voltage system, may be selected for control through the rheostat normally used in operating the projector. Thus it is possible to use the 100-volt range of lamps on any 200-volt house-wiring system.

When using the higher voltage range of lamps, however, it will be necessary to switch out the "dead" portion of the projector resistance or—alternatively—to acquire a special resistance capable of 100 per cent cut-out. Such can be picked up quite cheaply in the shops, though no electrically-minded amateur will have much difficulty in making the simple slate and slider

winding. Incidentally, the same accessory can be used in controlling the load on two 100-volt range lamps operated in series from a 200-volt household circuit.

Dimming.

The arrangement for dimming a single lamp is simple enough. It requires only a suitable plug at the end of the holder flex, the standard resistance fitting being allowed to remain unchanged.

Groups of two, three or more lamps may be arranged, in parallel, with only little more attention. This, of course, varies with the manner in which the amateur will require to use his lights; but in no cases are special difficulties likely to be encountered.

Finally, it should be remembered always to use the resistance with two objects in mind: in the first place, to prevent unnecessary waste when filming is not actually proceeding, and, secondly, to protect the lamp filaments from sudden voltage "shocks."

To achieve these objects, the current should always be gradually fed to the filaments—and focussing, etc., should always be conducted without using an excess of brilliant light. Such light is readily available and should, of course, be brought into play whenever the cameraman begins to operate.

The Week's Meetings

Wednesday, October 6th.

Brighton and Hove C.C. Annual General Meeting.
Croydon C.C. "A Short History of the Club." J. Keane.
Edinburgh P.S. Opening General Meeting.
Leominster P.S. "West Country School of Masons (Architecture)."
Luton and D.C.C. Annual General Meeting.
Mountain Ash C.C. "Lights and Lenses."
Northallerton and D.P. and C.S. Ciné Evening. J. W. Adamson.
Partick C.C. Opening Night, Winter Session.
Sohihull P.S. "Landscape and Seascape."
South Essex C.C. "Intensification and Reduction." T. D. Osborn.
S. Suburban and Catford P.S. Presidential Address. G. H. Dannatt.
Streatham P.S. Open Evening.
Windsorham C.C. Members' Films, Charity Programme.
Yeovil P.S. Print Criticism.
York P.S. "The Lochs, Glens and Bens of Western Scotland."

Thursday, October 7th.

Armley and Wortley P.S. "Ice and Snow in the Alps." W. R. Grist.
Bayswater and Paddington P.S. "Versatility." R. H. Lawton.
Blyth and D.C.C. Opening Meeting.
Bury P.S. "Hints to Beginners." T. Simmons.
Camberwell C.C. "Press Button B." G. H. Dannatt.
Hall Green P.S. "Bromoil Printing." C. H. Jones.
Hampshire House P.S. "Nilgiris or Blue Mountains of South India."
Herefordshire P.S. Opening Meeting. "The Alphabet of Photography."
Hinckley and D.P.S. "Lettering and Titles for Mounts." J. W. Chaplin.
Hull P.S. Ciné Evening.
Loughborough P.S. Social Evening. "Photograms of the Year" on view.
Oldham P.S. "Nature Work in the Field." G. B. Kearey.
Wimbledon C.C. President's Evening. J. H. Reeves.
Windsorham C.C. Members' Films Charity Programme.
Woolwich P.S. "Pictorial Landscape." J. H. Clark.

Friday, October 8th.

Royal Photographic Society. "Over the High Atlas to Marrakesh, Morocco."
Dartmouth L. and D.S.P.S. Lantern Slide Demonstration.
Harrogate P.S. "Yorkshire Gardens." C. F. Walker.
Windsorham C.C. Members' Films Charity Programme.

Saturday, October 9th.

Bedford C.C. R.P.S. Exhibition—London.
Hampshire House P.C. "Intensification and Reduction." C. E. Homer.
Ilford P.S. Autumn Tints in Epping Forest.
Ipswich and D.P.S. Open.
Kingston C.C. "Do you Know your Camera?" B. B. Hill.
N. Middlesex P.S. Night Outing. R. E. Bennett.
S. Suburban and Catford P.S. Night Outing to London (Men only).

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Monday, October 11th.

Bexley Heath P.S. "London's Rural Touches." S. E. Jones.
Blackburn and D.C.C. Composition by M. O. Dell.
Blackpool and Fylde P.S. New Travelling Exhibition of the L. & C.P.U.
Edinburgh P.S. Opening of Exhibition of Portfolio Prints.
Erdington and D.P.S. "The Abbey Church of St. Peter at Westminster." L.L.
Ipswich and D.P.S. Meeting.
Kidderminster and D.P.S. "Lenses, their Uses and Abuses." J. M. Cockin.
Leeds C.C. Work Night. Home Portraiture. H. Bryce Thomson.
Southport P.S. Beginners' Night. "The Camera."
Stourbridge Inst. P.S. "Enlarging." H. P. Newland.

Tuesday, October 12th.

Birmingham P.S. "Composition." H. J. Shepherd.
Cambridge P.C. "The Home Life of Some Familiar Wild Birds."
Eastbourne C. and Ciné C. "Time and Temperature Development."
Halifax P.S. "Enlarging." J. Halliday.
Harpden and D.P. and C.S. "Lights o' London." G. A. Slight.
Harrow C.C. "Table Top and other Topics." E. Heilmann.
Leeds P.S. "A Hundred of My Best Slides." J. Shaw.
Leith C.C. Technical Instruction: "The Camera and How to Use it."
Manchester A.P.S. "Some Experiences of a Bird Photographer." G. Dobson.
Newcastle and Tyneside P.S. "Gadgets." Members.
Newport (Mon.) C.C. Members' Print Competition. "Still Life."
Nottingham and Notts P.S. "Development and After-Treatment of Negatives."
Peterborough P.S. "A Naturalist on the Amazon." E. A. Robins.
Portsmouth C.C. First Print and Slide Competition.
Rugby P.S. "Simple Slide-Making." W. A. Watson.
Sheffield P.S. "The Etchadine Retouching Process." Messrs. G. H. Potts, Ltd.
Small Heath P.S. Ciné Display with some Colour Films. D. Royce.
South Shields P.S. "Photography at the Coronation." J. H. Cleet.
St. Bride P.S. Lantern Evening.
Warrington P.S. "By Car, Train and Steamer in Norway." H. P. Mitchell.
Winchester P.S. Demonstration of Slide-Making.

Wednesday, October 13th.

Brighton and Hove C.C. "Charcoal Black and Etchadine."
Croydon C.C. "The Treatment of Negatives." H. Alfred Hayes.
Edinburgh P.S. Meeting of Portfolio Contributors and others interested.
Hinckley and D.P.S. Demonstration on Lantern-Slide Making. H. W. Brookes.
Leominster P.S. Beginners' Night.
Mountain Ash C.C. One-Man Show. E. H. Griffiths.
Northallerton and D.P. and C.S. "Birds and Flowers of the Pickering District."
North-West London C.C. Meeting at 110, Haverstock Hill, Hampstead, N.W.3.
South Essex C.C. Portrait Evening.
S. Suburban and Catford P.S. "A Motor Rush through Spain." L.L.
Stafford P.S. Whist Drive at Co-op. Café.
Streatham P.S. "Exposure." C. E. Homer.
Windsorham C.C. Working Members' General Meeting.
York P.S. Social.

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

BENDING METAL TUBES.

SIR,—On again reading through "The A.P." for September 8th I was struck by a letter I had missed on the first reading.

Your correspondent Mr. Daniels states that to soften copper tubing for making photographic gadgets the tube should be made red-hot in a gas flame and allowed to cool. Actually, the correct method of annealing copper tube is to bring it to red heat and plunge it into cold water. This will make it really soft as copper acts in the opposite way to steel and some other metals. I draw attention to this, since, although slow-cooling will certainly soften to some extent copper that has "age-hardened" or been "work-hardened," the great extra softening from rapid cooling is a great asset when making complicated bends.—Yours, etc.,
R. CHAPMAN.

PERFORMANCE OF CHEAP CAMERAS.

SIR,—I quote from a well-known British lens manufacturer, who states that it is not possible to correct a lens fully for curvature of field.

The lenses fitted to the inexpensive miniatures will be fairly simple lenses usually of three-glass construction, and there will be a fair amount of this correction lacking. Roll film has a tendency to curl in the camera and this feature might explain the really good results which can be produced by such cameras and lenses.

I would advise Mr. Long that on their "Aurorange," Messrs. Ensign have a manually operated, combined sight-hole cover and pressure plate. The pressure is removed during winding of the film.

I have no connection with Messrs. Ensign, beyond use of their products.—Yours, etc.,
J. GENTLES.

THOSE VERTICALS.

SIR,—I would like to intrude a very small and respectful voice into the discussion between the critics of the rising front and Mr. W. L. F. W. (Being, unknown to Mr. W., one of his most enthusiastic pupils I am aware of his identity, but will keep his secret.)

So excellent a photographer as Mr. W. obviously cannot be guilty of an error in matters photographic, despite the incredulous comments I can almost hear him making. Nor (I add, with cowardly haste) have I any fault to find with the mathematical arguments of his opponents. How then can I, as an "ordinary person," reconcile these apparently opposite points of view?

I would like to venture the opinion that the explanation lies in the peculiarity of human behaviour mentioned in the very last line of Mr. W.'s article of September 15th, upon which greater emphasis should have been laid. Any two-dimensional representation of a three-dimensional scene or object is essentially an optical illusion. The human eye always assumes that the surface of such a representation lies in a vertical plane and relates the illusory perspective of the scene or object depicted accordingly. Hence the feeling of "falling backwards" conveyed by apparently converging verticals, which it is claimed can only be avoided by holding the print at an angle corresponding to that subtended by the focal plane of the camera at the moment of exposure. It seems doubtful, however, whether a method of presentation which can only be appreciated by the adoption of unnatural poses is defensible.

Or am I entirely wrong?—Yours, etc.,

RONALD SHAW.

FILM MATTERS.

SIR,—I was highly amused to read the letter from Mr. J. V. Gil in a recent issue. I have used backed films and unbacked 35-mm. films but I have never been able to detect any difference in quality between the two, and I am willing to wager that the most stringent tests under laboratory conditions would fail to find it.

Your correspondent has probably been unlucky in using a camera with an inefficient pressure plate, for with a film $2\frac{1}{2} \times 1\frac{1}{8}$ in., resting at each edge on a strip of metal and pressed firmly, I see no possible chance of a buckle. Any slack film caused by non-parallel film roller would for the same reason be pressed into the film chambers.

Cameras that snap open are invariably supplied with deep grooves around the film opening for the express purpose of neutralising the effects of suction. As regards the matter of film expansion, how many thousandths of an inch does celluloid expand even with an extreme rise of temperature?—Yours, etc.,
GEORGE L. WAKEFIELD.

Exhibitions and Competitions

CURRENT AND FUTURE.

The name and address in brackets indicates to whom to apply for further particulars.

The Amateur Photographer Monthly Competitions or Beginners, Intermediate and Advanced Workers.—Entries, October 30. Rules in the issue of September 29.

Wallace Heaton Competition. Cash prizes every week.—Open to readers of *The Amateur Photographer*. Full particulars in advertisement page in this issue. "Daily Mirror" Weekly Photographic Competition, "Queerios." Cash prizes. (The Editor, "Daily Mirror," Fetter Lane, London, E.C.4.)

XVIIe Salon International de Photographie de Belgique.—Open, May–October. (M. Julien Lejeune, 70, Av. Van Becelaere, Boitsfort, Brussels.)

XXXIIe Salon International d'Art Photographique de Paris.—Open, October 2–17. (Le Secrétaire, Société Française de Photographie et de Cinématographie, 51, Rue de Clichy, Paris 9e.)

I International Exhibition of the Photo-Press and Literature (Jugoslavia).—Open, October. (Fotoklub Zagreb, Masarykova II, Zagreb, Jugoslavia.)

Royal Photographic Society of Great Britain, 82nd Annual Exhibition.—Open, September 11–October 9. (The Secretary, Royal Photographic Society, 35, Russell Square, W.C.1.)

Woolwich P.S.—Twenty-first Exhibition. October 11–16, Old Town Hall, William Street, Woolwich. Open daily, 1.30 to 9.30 p.m. Admission free. Also Snapshot Competition. Open to members in the district. Entries close, October 9. (R. E. Perry, 51, Kinveachy Gardens, Charlton, S.E.7.)

London Salon of Photography.—Open, September 11–October 9. (The Honorary Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.)

The Victorian International Salon.—Open, October 18–30. (C. Stuart Tompkins, The Junction, Camberwell, E.6, Victoria, Australia.)

International Photographic Exhibition, Budapest.—Open, October. (Modern Magyar Fényképezők, VIII, Rákóczi-ut, 19, Budapest, Hungary.)

Windsorham Camera Club.—Open, October 21–23. (J. C. Hayward, Hallgrove, Bagshot, Surrey.)

Folkestone C.C. Exhibition of Photography.—Entries, October 16; open, October 23–December 4. (A. J. Stewart, 25, Guildhall Street, Folkestone.)

Fourth Canadian International Salon of Photographic Art.—Open, October 23–November 15. (Exhibition Secretary, Canadian International Salon of Photographic Art, The National Gallery of Canada, Ottawa, Canada.)

Rotherham Photographic Society, Forty-eighth Annual International Exhibition.—Open, October 12–16 inclusive. (E. G. Alderman, Ruardean, Newton Street, Rotherham, Yorks.)

Sixth Irish Salon of Photography.—Open, October 30–November 6. (The Hon. Secretary, 18, Morehampton Road, Dublin.)

Cyclists' Touring Club (Metropolitan D.A.) Second Annual Photographic Competition.—Open, October 28–30. (G. H. Craddock, 9, Lady Margaret Road, Kentish Town, N.W.5.)

Lincoln C.C. Eleventh Annual Open Exhibition.—Open, October 29–November 26. (Miss E. Redfern, 8, Cecil Street, Lincoln.)

G.E.C. (Coventry) P.S. 4th Annual Exhibition.—Entries, October 14; open, November 8–13. (C. W. Crowe, G.E.C. (Coventry) Photographic Society, General Electric Co. Ltd., Coventry.)

Bournemouth C.C. Open Exhibition of Pictorial Photography.—Entries, October 18; open, October 25–30. (John Reid, Westminster Hall, Beacon Road, Bournemouth.)

International Salon Oval Table Society, Inc.—Entries, October 23; open, November 16–30. (Oval Table Society, Inc., 10, W. 23rd Street, New York.)

1st Rhode Island National Salon of Photography.—Entries, November 1; open, November 15–30. (J. Clement Grimes, 103, Westminster Street, Providence, Rhode Island, U.S.A.)

International Photographic Exhibition in Debrecen (Hungary).—Entries, November 20; open, January. (Aszmann Ferenc, Ferenc Josef ut 27, Debrecen Hungary.)

XIe International Fotosalon "Iris".—Open, January, 1938; last day for prints and entry forms, November 30, 1937. (F. Geeraerts, Braderodestr. 22 Antwerp, Belgium.)

Second Indian International Salon of Photographic Art.—Entries, January 15; open, March, 1938. (N. B. Cooper, Hon. Sec., Camera Pictorialists of Bombay, 53, Nicol Road, Ballard Estate, Bombay, India.)

Leicester and Leicestershire Photographic Society's International Exhibition of Pictorial Photography.—February 21–March 12, 1938. Last day for entries, January 29, 1938. (H. Foscutt, 19, Doncaster Road, Leicester.)

Ilford P.S. International Exhibition of Photography.—Entries, January 31, 1938; open, March 7–12, 1938. (D. H. Cole, 11, Woodlands Road, Ilford, Essex.)

Edinburgh Photographic Society 76th Annual Open Exhibition.—Open, March 9–April 2. Entries, February 28. (John S. Rodger, 16, Royal Terrace, Edinburgh.)

Runcorn C.C. Open Exhibition.—Entries, February 18; open, March 23–26, 1938. (R. J. Edwards, 1, Waterloo Road, Runcorn, Cheshire.)

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS

"In Town To-night" is the appropriate title of the latest exhibition at the Ilford Galleries, 101, High Holborn, W.C.1. It consists of a series of fine character studies by Douglas, each depicting one of the people who have from time to time been "on the air" to broadcast their experiences in the popular B.B.C. feature "In Town To-night." At the opening on September 27th, by Mr. Eric Maschwitz, several of the originals of the portraits were present. The prints in every case call for praise for their technical and pictorial qualities, apart from their "news values." The exhibition remains open for a month, and admission is free.

Owing to a misprint, the Photoflood lamp advertised by Mr. Rudy Starita in our issue of the 29th September, was erroneously described as 100-watt instead of 1,000-watt.

We have received particulars of the two photography courses to be held at the Borough Polytechnic during the coming session. Both classes provide instruction of an essentially practical nature, and a fully equipped dark-room provides facilities for useful practical work. The classes will be conducted on similar lines to those of previous years, the Friday classes consisting of lectures, demonstrations and practical work, while Mondays will be devoted to practical work entirely. The lecturer will be Mr. Robert Coombs, who is also running a course of lectures, "The Art and Science of Photography," at the Dalston Literary Institute, Colvestone Crescent, Dalston, E.8, on Tuesday evenings at 7.45, and on Wednesday evenings at 8 a class for men only at the Southwark Men's Institute, Union Street, Southwark, S.E.1.

The Amateur Ciné Service Ltd., of 52, Widmore Road, Bromley, Kent, are opening new showrooms at 6, Gray's Inn Road, Holborn, W.C.1. It is the earnest intention of the Amateur Ciné Service to give the same personal care and attention to customers in London as that for which they were known in Bromley, which still remains the firm's headquarters and Mail Order Department. Hours of business at the London showrooms are 9 a.m. to 6.30 p.m., close Saturday at 1; and in Bromley 9 a.m. to 8 p.m., close Wednesday 1 p.m.

It will interest many of our readers to know that strips of negatives by contact on panchromatic film from Agfacolor and Kodachrome strips can be made at the cost of 7s. 6d. per strip of 36. This service is offered by Wallace Heaton Ltd., 127, New Bond Street, W.1. Strip prints from 36-exposure 35-mm. negatives, and film transparency strips at 3s. 6d. and 5s. respectively are also supplied by the same firm.

On October 6th at 8 p.m. the members of the Streatham Photographic Society will meet at their headquarters to describe and demonstrate their enlargers—home-made and otherwise, with constructional details and particular methods of working. The Secretary of the Streatham Photographic Society, Mr. Douglas F. Weare, 89, Bedford Hill, Balham, S.W.12, will be pleased to supply particulars of the society's activities to all who may be interested.

On September 18th whilst travelling from Croydon Airport to his home at 15, Montague Square, W.1, via Imperial Airways bus to Victoria and then by private car, one of our readers, Mr. John Brigham, mislaid his camera, for the recovery of which he is offering a reward of £5. The camera was a Contax III, No. B.49301, with an f/2 lens. Will any reader who may be able to assist in tracing the missing camera please communicate with Mr. Brigham at the above address.

The title of the latest prize-winning print in the Wallace Heaton "Travel Snaps" competition was "Old Hildesheim," by William Allen, 2, Glenwood Road, Ewell, Surrey. Full particulars regarding the new Wallace Heaton "Novelty" competition will be found in our advertisement pages.

The Bayswater and Paddington Photographic Society commences its activities for the new session by an open meeting—subject, "Versatility," by R. H. Lawton—at the Town Hall, Paddington, W.2, at 8 p.m., Thursday, October 7th. Particulars of membership and further meetings from the Hon. Secretary, W. T. Green, 113, Queen's Road, Bayswater, who also extends a hearty invitation to all interested to attend the first meeting as above. The lecturer, Mr. Lawton, the Hon. Treasurer of "The Royal," is a guarantee of an excellent evening.

The 33rd Annual Exhibition of the City of London and Cripplegate Photographic Society is being held at the Cripplegate Institute, Golden Lane, E.C.1, on March 7th–12th, 1938. Mr. F. J. Mortimer will again be the judge. Entry forms will shortly be available from the Hon. Exhibition Secretary, Mr. R. C. Dye, The Flats, Chesham Road, Wigginton, Herts, and in addition we shall have a limited supply at this office. The closing date for entries for the above exhibition is February 7th, 1938.

Mr. G. Wood, of 48, South Road, Southall, Middlesex, informs us that he has been elected secretary of a newly-formed club, known as the Southall and District Photographic Society. This club meets every Monday at the address given above, and intending members who would like to know more about the society are asked to write to the Hon. Secretary, who will be pleased to give them any further information they may require.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. The series from No. 1 to 61 included all standard chemical and optical formulæ and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulæ issued by the leading manufacturers of plates, films and papers.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5 × 3, supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is 5½ × 3½ × 3 and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

95. Makers' Formulæ: Developers for Ilford Papers—(1)

ID-20. M.Q. for Bromide Papers.

Metol	15 grs. (1.7 grm.)
Sodium sulphite (anhydrous)	220 grs. (25 grm.)
Hydroquinone	60 grs. (6.8 grm.)
Sodium carbonate (anhydrous)	245 grs. (27.5 grm.)
Potassium bromide	20 grs. (2.25 grm.)
Water up to	20 oz. (1,000 c.c.)

If crystallised sulphite is used, take 440 grs. (50 grm.). If crystallised carbonate is used, take 660 grs. (75 grm.).

For use, dilute with an equal volume of water.

ID-36. M.Q. for Gaslight Paper.

Metol	14 grs. (1.5 grm.)
Sodium sulphite (anhydrous)	220 grs. (25 grm.)
Hydroquinone	55 grs. (6.25 grm.)
Sodium carbonate (anhydrous)	300 grs. (34 grm.)
Potassium bromide	4 grs. (0.5 grm.)
Water up to	20 oz. (1,000 c.c.)

If crystallised sulphite is used, take 440 grs. (50 grm.). If crystallised carbonate is used, take 880 grs. (92 grm.).

This developer should be used without dilution.

It is obtainable, as Selo M.Q. developer, in packets and tins.

ID-30. Amidol.

Sodium sulphite (anhydrous)	220 grs. (25 grm.)
Amidol	60 grs. (6 grm.)
Potassium bromide	2 grs. (0.2 grm.)
Water to	20 oz. (1,000 c.c.)

If crystallised sulphite is used, take double the above quantity.

This developer does not keep in solution, and is used undiluted. Prints should be fully developed.

Use as above for gaslight paper; for bromide paper increase the potassium bromide to 8 grs. (0.8 grm.), which makes formula ID-22.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Remuneration.

A stationer here has asked me to take some photographs of local views for him, with the intention of reproducing them as postcards. Can you advise me as to what I should charge him for the copyright of my negatives? P. V. (Suffolk.)

The question you put is one purely of arrangement, and there is no regular price for such work. It is entirely a matter of what the tradesman is prepared to pay and what you are prepared to accept, and we have no idea whether you can secure the negatives easily, or whether they will involve considerable work and trouble. This, quite obviously, will have some bearing on the price you should charge.

Extra Acid.

Can I add metabisulphite to a hardening-fixing bath containing alum, acetic acid, and sodium sulphite? I have always used it in ordinary non-hardening fixers, and much value its effect in stopping development and preventing stains. J. W. (Retford.)

There is no need to add metabisulphite to the fixer you mention, as the combination of acetic acid and sodium sulphite takes its place. You will find the bath just as effective in stopping development and preventing stains as the non-hardening bath to which you are accustomed.

Darkening a Room.

I want to put up a blind to darken my bathroom for photographic purposes, but I do not know where to get any perfectly opaque material. Ordinary blind fabric is not quite opaque, and is in most cases dotted with pinholes. D. E. B. (Kettering.)

You are quite right in supposing that ordinary blind material will not answer, although it would probably do so if you could use two thicknesses of it. But spring blinds for dark-rooms are made commercially, and you might be able to obtain suitable material from Messrs. James A. Sinclair & Co., Ltd., 3, Whitehall, London, S.W.1, from whom complete blinds are also obtainable.

Home-made Enlarger.

My problem is to find the necessary relationship (i.e., distances) between light, condenser, negative and lens in an enlarger I am about to make. Can you help me, please? A. C. (Cheshire.)

You will have to find the relative positions by experiment. Briefly the question should be attacked by first fixing the condenser close to the negative, and between the negative and the lamp. The position of the lens, which varies according to the degree of enlargement, is next settled by simple focussing to get a sharp image. When the placing of this is found, you should take out the negative and move the light nearer to or farther from the condenser until you get a bright even disc of light on a sheet of white paper fixed to the easel. To avoid having to reset the light for each change in the degree of enlargement, you may prefer to use an opal lamp, or a sheet of ground glass between lamp and condenser, even though either of these expedients will cause some loss of light.

Reticulation.

The enclosed negative is not as clear as it should be, I think, and several films I have developed recently have dried showing this opalescence. Can you tell me the cause of it? A. Y. (Liverpool.)

The gelatine on the plain side of your film is suffering from a mild form of reticulation. This is generally due to transferring the film from one solution to another with a somewhat marked difference in temperature, or it may arise if one solution contains much more dissolved material than another. If you keep your various solutions, including the wash-water used between development and fixation and that to which the fixed film is first transferred, all at about the same temperature, and avoid the use of too strong a hypo-bath, we do not think you are likely to meet this trouble again.

Developing Panchromatic Plates.

The boxes in which panchromatic plates are packed bear the instruction that the plates must be handled in complete darkness, but I have seen it stated that a green light can be used. Can you explain the contradiction? F. W. L. (Birmingham.)

The statements to which you refer are not so much in conflict with each other as you think. You can get a green panchromatic safelight for your dark-room lamp, but the light is so very dim that many workers consider it is no advantage to use it, and they prefer either to handle the films in darkness, or, what is really more convenient, to desensitise them first.

Making an Enlarger.

Can you give me a design for making an enlarger utilising a 9 x 12 cm. double extension camera with lens of focal length 13.5 cm.?

K. R. N. C. (Renfrewshire.)

Even were we in possession of more details than you give us, we could not undertake to design an enlarger for you. In any case, such a matter falls rather outside the scope of a reply to a query. We think that the most useful suggestion we can make is that you send to Messrs. J. Lancaster & Son, Ltd., 54, Irving Street, Birmingham, 15, enclosing 3d. in stamps, and asking for their catalogue of "Form A" enlargers, and also of enlarger parts and the methods of adapting them.

Photographing the Invisible.

Can you explain how the enclosed photograph, taken by moonlight, shows far more than the eye could see? It had a long exposure, and shows quite good detail in shadows that to the eye appeared solid black. W. F. L. (Belfast.)

There is nothing mysterious about your photograph. The result is due to the simple fact that there was quite enough light present, however it may have appeared to the eye, to give you all the detail shown with such a long exposure as you gave.

Making a Lens Hood.

Can you give me a formula for finding the maximum depth I can make a lens hood? I want the fullest screening effect without danger of cut-off. J. E. F. (Surrey.)

We know of no formula for doing what you require. The course generally adopted is to make the hood too long, and then to cut it down until an examination of the image on the focussing screen shows that the corners are not being obscured. If a rising front is to be used this will necessitate further shortening of the hood, and so also does the use of smaller stops. You will see that the whole thing is a matter for actual test.

Choice of Filters.

What kind of colour filter do I need for correct colour rendering, and for cloud effects in landscapes? G. E. L. (Gillingham.)

The chief aid to getting correct colour values is to use panchromatic material. If you want to keep out some of the blue rays a yellow filter will answer the purpose, but the question of colour filters and their use is quite a large one. We should recommend you to obtain "The Photography of Coloured Objects," published by Messrs. Kodak Ltd., at 2s. 6d. It can be obtained from The Fountain Press, 19, Cursitor Street, E.C.4.

SEASON OF MISTS!

Rustle of russet leaves in a flurry of wind ; sweet smell of clover on the evening breeze ; glowing sunsets, then heart-aching nocturnes on London River ; white mists sweeping across Scottish moors ; autumn blossoms in Cornish fields ; golden leaves falling from stately sycamores ; birds planning their long migrations ; white-sailed craft, reefed down in a blow, making for laying-up quarters ; harvest festivals in country churches !

Miniaturists exchanging slow cameras for models with ultra-fast lenses ; FF and F giving way slowly to ISS ; Sease 3 ceding its pride of place to Paraphenylene-diamine-metol ; print albums, negative albums, enlargers and lantern slides occupying the longer evenings. In fact, autumn ! We do not need to emphasise the fact that we are best suited to meet your every requirement—too frequently to present our claim might prove tedious, so we simply say "Try 202 for Service !"

BE ARRESTED—

for a while by our news of the new MULTIFAX enlargers, the advent of which we heralded last week. We give below the high-lights of their unique specification, and it will be realised by every miniaturist conversant with the enlarging apparatus previously available for his use that here is a new-comer of no mean worth. And now, sirs, we pray you, read on!—

- (1) the enlarger may be instantaneously swivelled into the horizontal position for use as a projector ;
- (2) an excellent tall lamphouse is fitted with an adjustable lamp ;
- (3) together with the double condenser which is supplied, there is an opal disc, which may be employed, as and when required, to obtain a softening effect ;
- (4) the enlarger is constructed on the girder principle, there being no less than three uprights. This, of course, eliminates vibration completely ;
- (5) an f/4.5 enlarging anastigmat is fitted, complete with iris diaphragm ;
- (6) simply by the slackening of a wing-nut, the whole enlarger revolves on the column to enable really big enlargements to be made, with the floor used as an easel instead of the baseboard ;
- (7) the enlarger has a liftable negative holder, which allows the film to be used in strip form ;
- (8) for convenience, an orange swing filter is incorporated in the design.

Prices: For negatives up to 4×4 cm. £9 5 0
 For negatives up to 6×6 cm. £13 10 0
 For negatives up to 6.5×9 cm. £14 15 0
 (Lamp 3s. 6d. extra ; please state voltage.)

COME HITHER, COME HITHER!

They tell us that there are those who have experienced difficulty in obtaining one or another of the following articles ! 'Tis shame upon us that we did not let you know before that we have all of the following in stock, and available for your immediate use. It should be remembered that, whatever you want, we almost certainly have it in stock.

1. The Reflex-Korelle New Automatic Model IIa, fitted f/2.8 Tessar lens £25 15 0
2. The New Chromium Exakta Cameras. All models in stock, with an increase of 30s. on the prices of the black models.
3. The Leitz Fully Automatic Focomat Model II Enlarger, for all negatives up to 3½×2½ in. £50 12 6
4. The Leitz Variable Enlarger VYOOS, for all negatives up to 3½×2½. £34 8 6
5. The New Leitz Model VIIIIS Projector, fitted 8.5-cm. f/2.5 Hektor lens for high intensity projection £18 2 6
6. The Leitz Near-Focussing device, NOOKY. £5 12 6

WE ARE THE ONLY ALL-MINIATURE FIRM!

The following used cameras are typical of our immense range of second-hand bargains. Although the prices are noticeably lower than those asked elsewhere for similar instruments, every camera is tested and backed by our guarantee. The most generous part-exchange allowances are given and hire-purchase terms can be arranged over any period up to 24 months.

LEICAS :

Leica IIIa, f/2 Summar lens, ever-ready case. As new £35 10 0
 Leica III, chromium, f/2 Summar, E.R. case. As new £31 10 0
 Leica II, black, f/3.5 Elmar, E.R. case. Practically as new £19 10 0
 15-cm. f/2.3 Astro for the Leica, with reflex attachment. Cost £95. As new £55 0 0

CONTAXES :

Contax Model III, f/2 Sonnar, E.R. case. As new £49 10 0
 Contax Model II, f/2 Sonnar. As new £39 17 6
 Contax Model I, as above, but fitted f/2.8 Tessar £21 10 0

MINIATURE CAMERAS FITTED WITH COUPLED RANGE-FINDERS :

Super Ikonta 530/2, f/4.5 Tessar, Normal Compur. Excellent condition £11 10 0
 Super Ikonta Model 530/16, latest improved model with film wind stop, f/2.8 Tessar, case. As new £21 15 0
 Super Ikonta 530, f/3.5 Tessar, Rapid Compur, case. As new £14 10 0
 Baldaxette I, f/2.8 Xenar, Compur, special parallax adjusting view-finder. As new £12 17 6
 Ensign Autorange, f/4.5 Ensar. As new £6 18 6
 Ensign Multex II, chromium, f/3.5 Multar, E.R. case. As new £13 10 0
 Another, as above, fitted f/1.9 Ross Xpres. As new £24 17 6

THE FAM!

Just a word of appreciation, to show how grateful we are to the makers of the FAM enlargers for having introduced such a really fine automatic model ! We have been using several in our developing and printing works during the summer, and they have constantly produced excellent work during the whole of the busiest season that the works has ever experienced. The FAM has more than won its spurs, and, enthusiastic as we were before, we are even more so after the wonderful showing it has put up. The model to which we refer is the 18-guinea 6×6 cm. enlarger, but we should be delighted to send our booklet "Miniature Enlargers and Accessories," giving details of the complete range, free and post free upon request.

MINIATURE CAMERAS FITTED WITH COUPLED RANGE-FINDERS—contd. :

Peggy Model 2, coupled range-finder, film-cutting device, f/3.5 Tessar. Excellent condition £13 15 0
 Compass, latest improved type. As new £19 10 0
 Kodak Regent, f/4.5 Tessar, case. As new £13 18 6

MINIATURE REFLEXES :

Kine-Exakta, f/2.8 Tessar, case. As new £31 10 0
 Latest Automatic Rolleiflex 6×6, f/3.5 Tessar. As new £18 17 6
 Automatic Rolleiflex 6×6, f/3.8 Tessar, Compur, case. Excellent condition £14 10 0
 Rolleiflex Automatic 6×6, fitted f/4.5 Tessar. Good condition £13 15 0
 Pilot Reflex, f/2.8 Tessar, Compur. Excellent condition £12 15 0
 Ditto, fitted f/3.5 Tessar £10 15 0

MINIATURE REFLEXES—contd. :

Rolleicord I, f/3.8 Triotar. Practically as new £10 10 0
 Lever-wind Multi-speed Exakta Model B, f/1.9 Dallmeyer Super-Six, improved type. As new £24 10 0
 Exakta Lever-wind Model B, f/2.8 Tessar. As new £21 10 0
 Voigtlander Brilliant, f/4.5 Skopar, Compur Rapid. As new £5 0 0
 Ikoflex II, f/3.5 Triotar, E.R. case. As new £12 17 6
 Reflex-Korelle I, f/2.9 Radionar. As new £10 15 0
 Reflex-Korelle I, f/3.5 Radionar. As new £9 15 0
 Primarflex, f/2.8 Trioplan. As new £23 15 0
 9-in. f/5.6 Dallon, for above. As new £9 17 6

MISCELLANEOUS CAMERAS :

520 Ikonta, f/3.5 Novar, Rapid Compur, case. As new £7 5 0
 Baby Ikonta, f/3.5 Novar, Compur, case. Excellent condition £5 15 0
 Agfa Karat. Condition as new £4 0 0
 Agfa Baby Speedex, f/3.9 Solinar, Compur. As new £3 18 6
 Retina, f/3.5 Xenar, Compur shutter. Excellent condition £6 17 6
 Dollina I, f/2.9 Radionar, Rapid Compur. As new £7 10 0
 Miniflex, f/1.8 Astro Pantachar. Cost £19 10s. As new £12 0 0
 520 Ikonta, f/3.5 Tessar, Normal Compur, case. As new £8 5 0
 Robot, f/2.8 Tessar, 2 cassettes. As new £21 10 0

ANNUAL Lantern-Slide Competition 1937

EVERY reader of *The Amateur Photographer* who is interested in the making of lantern slides should participate in "The A.P." Annual Lantern-Slide Competition. Not only are the seven classes comprehensive in their variety of subjects to suit all workers, but inclusion of slides in "The A.P." prize set which circulates throughout the British Isles can be considered as the hall-mark of excellence, which every lantern-slide maker should strive for. Each succeeding year the competition proves increasingly popular, and has come to be regarded as a test of merit in lantern-slide production. We hope, therefore, that again this year every lantern-slide maker will enter the competition. The conditions and awards are set out below. It should be noted that

the awards are made to individual slides and not to sets; but every competitor can send as many slides into as many classes as he or she desires. The slides are judged on the screen under the best conditions. After the judging the prize-winning slides, and a number of others which are selected for purchase, form the exhibition collection which goes on tour to all parts of the country for a year or more. Secretaries of photographic societies who have not yet booked the set of "A.P." Prize Slides should hasten to do so and submit alternative dates. This is necessary to enable a complete and expeditious itinerary to be arranged before the slides start on their journey in November. In the meantime, those who intend entering this competition should note that the closing date for receiving entries is Monday, November 1st.

Classes and Subjects.

- CLASS I.—Landscape with or without figures, sea subjects and river scenery.
CLASS II.—Portraiture and figure studies, whether indoor or outdoor pictures.
CLASS III.—Architecture, interior and exterior.
CLASS IV.—Flowers, fruit and other "Still-Life" subjects.

- CLASS V.—Natural History subjects.
CLASS VI.—Lantern slides in colour (not hand-coloured).
CLASS VII.—Champion Class. Open only to those who have won silver or bronze plaques in *The Amateur Photographer and Cinematographer* lantern-slide competition.

Conditions and Awards.

(1) All classes are open to amateur and professional photographers without any restrictions. All slides must measure $3\frac{1}{4} \times 3\frac{1}{4}$ in., and must be properly spotted for showing in the lantern.

(2) One silver plaque, one bronze plaque, and four certificates are offered in each class except Class VII. In that, the Champion Class, the award will be a mounted and signed exhibition picture by Mr. F. J. Mortimer, the Editor of *The Amateur Photographer and Cinematographer* and *Photograms of the Year*.

(3) All slides which receive any award will become the property of *The Amateur Photographer and Cinematographer*, and will be sent round amongst the societies and such other associations as apply for the loan of them. Any other slides may be selected for circulation in this manner, and will be paid for at the rate of half a crown each.

(4) Competitors may send any number of slides in any class, and may be recorded as winning any number of awards; but no competitor will actually receive in the competition more than one silver plaque, one bronze plaque, and one certificate, on which all his awards will be recorded. Competitors may enter in any number of classes.

(5) Each slide must bear the competitor's name, its title and its class. With the slides must be sent an envelope containing the name and full address of the competitor, a list of

the titles of all the slides he is sending in, and the class in which such are entered. Particulars as to make of plate, exposure, developer used, etc., and other technical data which may be of interest for incorporation in the notes which will accompany the winning slides on their tour among the photographic societies, should also be given where thought necessary.

(6) A stamped and addressed label (not loose stamps) should be sent with the slides for their return if unsuccessful; but in no circumstances can the Editor or the Publishers accept any responsibility for slides sent in for competition, nor for their return; neither can slides be returned which are not accompanied by stamps as above.

(7) Not more than one slide from any one negative can be admitted, nor may any slide compete which has before won an award in these competitions.

(8) The last day for receiving is Monday, November 1st. The slides must be well packed and addressed, "Slide Competition, The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and all carriage charges must be prepaid.

(9) In any case of dispute, the competitor agrees to accept the decision of the Editor of *The Amateur Photographer and Cinematographer* as final.

The "PATENT ETUI"

The thinnest and lightest of all cameras.

THE "PATENT ETUI," ALTHOUGH SMALLER, THINNER, AND LIGHTER THAN MOST SO-CALLED MINIATURE CAMERAS, GIVES LARGE PICTURES WITHOUT ENLARGING.

3½ x 2½ Junior Model Patent Etui Camera, with f/4.5 Radionar lens in focussing mount, with F.P. holder and focussing screen

With Vario 3-speed shutter.....	26 5 0
With D.A. Ibsor 7-speed shutter, 1 to 1/125th sec....	27 10 0
With D.A. Compur shutter, 1 to 1/250th sec.....	28 10 0

3½ x 2½ in. or 9 x 6.5 cm. Patent Etui, double extension, Carl Zeiss f/4.5 Tessar lens, Compur shutter..... £15 7 6

4½ x 3½ in. or 12 x 9 cm. Patent Etui, double extension, Carl Zeiss f/4.5 Tessar lens, Compur shutter..... £17 10 0

Prices of Standard Models include 3 plate-holders in wallet.

£50 LOWER

The NEW 16-mm. "Gorse-Devry" Sound Projector saves you £50 against any other make of similar value, volume, light and features. Also this new "Talkie" has many essential features not obtainable in any other machine in the world's market.

SENSATIONAL "TALKIE" VALUE

16-mm. "Gorse-Devry" Sound Projector, largest super lens, 750-watt direct illumination, via 2-in. large condensers and booster reflector, 8-watt genuine volume (17-watt peak), 1,600-ft. capacity by unique "swing-up" reel arms, illuminated controls on onyx panel (seen in the dark during projection), double exciter lamps (slide one in position if the other fails without stopping the show), quickest "no-delay" threading, accessibility to all threading parts, finger and hand-room with minimum sprockets, silent or sound speeds—silent speed is adjustable; detachable gate—dirty and woolly fringed gates are a thing of the past. Rubber mounted throughout by Silent-broc. Amplifier has three controls, volume control, tone control, microphone control, by large circle pointers giving minute adjustment. The tone control is an essential "talkie" feature as it can be regulated to suit hall "acoustics," voice, music, or vocal. Microphone socket fitting, and gramophone fitting are features to provide speeches or records to own silent films. The amplifier components are "over-size" standard theatre ones, maintaining the "De Vry" policy of the finest value for money, long life and perfection.

AND here is the "Heart" of the machine—the film drive is by perfect intermittent sprocket which holds film in edge contact CONTINUOUSLY by rotation. There is no "push in and out," "grab and miss" claw action. The "De Vry" has the "theatre" movement which has proved to 35-mm. people to be the ONLY action for perfection. Intermittent movement means no oiling, and costs a large amount to produce, against claw which is a simple punch press job.

AND NOW.—The price saves you £50 over any other similar value.

ENSIGN

INDOOR LIGHTING EQUIPMENT

Multiflood Outfits

These Outfits enable the intense light from "Photoflood" lamps to be concentrated on the subject to be photographed. By using them shorter exposures can be made than the "Photoflood" used alone would permit. The reflector is mounted on a universal joint which enables the light to be projected in any direction—upwards, downwards or sideways. The wire stand is also so made that it will stand anywhere, hang on the back or arm of a chair or from a picture rail.

PRICES:

MODEL 1 (illustrated). Outfit includes stout cardboard reflector, fitted with bakelite lampholder, 6 ft. of flex and plug, and universal head stand. Complete in box (without lamp) **6s. 0d.**
MODEL 2. Outfit includes strong aluminium reflector, fitted with bakelite lampholder, 6 ft. of flex and plug, and universal head stand. Complete in box (without lamp) **10s. 6d.**
LAMPS. Osram Photoflood lamp **2s. 6d.**

Photo Flash-Bulb Outfits

No Smoke—No Noise—No Dust—No Smell.

A very simple and inexpensive method of obtaining 100 per cent brilliance and efficiency from flash-bulbs. Each bulb gives one flash.

No. 0 Outfit with 2 flash-bulbs, Silverlite folding reflector, torch, battery and test-bulb **5s. 6d.**
No. 1 Outfit, with 2 flash-bulbs, Multiray metal reflector, torch, battery and test-bulb **12s. 6d.**
FLASH-BULBS. Large, for groups up to 40-50. Philips Photoflux 1/4, Sashalite 1/3. Small, for close-ups and groups of 4-5, Philips Photoflux 10d., Sashalite 8d.

MINICAMERAS, MOVIES AND PERSONAL SERVICE

We are specialists in these brother hobbies, and offer free technical unbiased advice to callers or by post. Our staff are all competent to discuss your miniature camera and cine problems, and we find this especially useful to customers interested in both, as it enables them to have the personal service of whichever member of the staff they are in the habit of dealing with.

Any models listed below may be inspected at the Branch most convenient to you, and are issued with a six months' written guarantee.

THE NEW AUTO-VERTEX ENLARGER

Now in stock at our Holborn Branch. The complete range, whilst not yet available, comprises models to take Leica lenses, Contax lenses, and models with f/4.5 or f/3.5 anastigmats for 4×4 cm., 6×6 cm., and 6×9 cm. They are fully automatic and prices range from £11 11s. We invite your inspection, as the workmanship and price should challenge comparison.

THE NEW WITELITE CINE SCREEN

In stock at our Holborn Branch. No loss of brilliance at an angle. Superior rendering of half-tones. Elimination of grain. Practically fadeless and scratchproof. Ideal for Kodachrome. Attractive prices.

GET A GOOD ENLARGER ON OUR EASY PAYMENTS

There's no selection to equal that at Wallace Heaton's—the merits of every model can be compared in our demonstration rooms. Come and see them and test them for yourself—you will then be satisfied that you have got the very model to suit your needs. We have them in all negative sizes, and at prices ranging from 5 guineas upwards. Any model between £5 and £10 can be had on 15 monthly payments, or, if it costs £10 or more we give you two years to pay. Good allowance on your used apparatus in part exchange.

FIRST PAYMENT SECURES YOUR ENLARGER

PRAXIDOS

Non-automatic enlarger for all miniature negatives up to 6×6 cm. The lamphouse can be raised or lowered on releasing a lever and is automatically locked in place when the desired size of enlargement is obtained. Enlargement is 1.6 to 6 times linear. It has opal diffusing screen for single or double condenser and illumination can be suited to dense or contrasty negatives. With $f/4.5$ 7.5-cm. focus lens and iris diaphragm. **£10**

24 monthly payments of 9/5.

**EXCHANGE YOUR
Out-of-Date MODEL**

LEITZ FOCOMAT I

For Leica and other size negatives up to 3×4 cm. Designed for use with any of the standard 5-cm. interchangeable Leica lenses. Gives automatic enlargements of from 2 to 10 diameters and larger sizes by visual focussing. **£16:6:6**

24 monthly payments of 14/4.

FOCOMAT II (As illustrated).

Suitable for negatives up to $3\frac{1}{2} \times 2\frac{1}{2}$ in. With 9.5-cm. Elmar enlarging lens. **£50:12:6**

24 monthly payments of 45/5.

LEITZ "VALOY" ENLARGER

Suitable for negatives up to 3×4 cm. With baseboard and 20-in. upright. Projector head with large size lamphouse, 75-watt bulb in centring mount for direct connection to the mains. Without lens but with helical movement to take Leica lens or special enlarging lens. **£9:11:6**

15 monthly payments of 13/5.

T.P. IMPERIAL ENLARGER

Micrometer screw focussing front. Reversible negative carrier. Spring controlled carrier guide, bellows connection between lamphouse and condenser. Removable diffuser. It is an ideal outfit for a beginner. Models for $\frac{1}{4}$ -pl. and $\frac{1}{2}$ -pl. sizes. Imperial, without lens, $\frac{1}{4}$ -pl.

£5:15:6

15 monthly payments of 8/1.

SEND FOR OUR NEW ENLARGER LIST!

Just off the press—the best list of its kind ever published. Absolutely comprehensive—everything you want for the dark-room. Free. Send 2d. postage.

"Mixed Grill"

Call at our Bond Street Galleries, any time during October, and see the splendid exhibition of photographs by E. M. HEIMANN, A.R.P.S. You will find it a good and attractive show. Come and browse round at your leisure.

Free of course.

ZEISS MIRAPHOT

Automatic focussing. Simple in operation. A pull on the focussing lever is all that is required to focus and control size of enlargement. For any house circuit. For negatives up to $3\frac{1}{2} \times 2\frac{1}{2}$ in. Complete with $f/6.3$ Novar enlarging anastigmat

£8:2:6

15 monthly payments of 11/5.

Every other Zeiss Ikon Enlarger in stock.

**EVERY MAKE
Always in Stock.**

MAGNAPRINT

Its tubular mounting is very rigid, free from vibration. For focussing the body slides freely on the supporting column, and clamps in the required position. Fine focussing is then carried out by the helicoidal lens mount, which is provided with a large knob which locks it firmly in position at the required point. Takes half-V.P., Leica and Contax negatives

With $f/6.3$ lens

£5:5:0

15 monthly payments of 7/5.

M & W "FAM" ENLARGER

Fam III for roll films and plates up to 6×6 cm. Double anastigmat $f/4.5$ 9-cm. lens with iris stop, exchangeable against additional lens 5.5-cm. focal length, with manual focussing. Condenser with 100-watt oral lamp. Dual control, rise and fall and fine focussing. **£18:18:0**

24 monthly payments of 17/-.

ILFORD

**HYPERSENSITIVE
PANCHROMATIC PLATES**

Made in England by **ILFORD LIMITED, ILFORD, LONDON**

There's a different world at your doorstep—waiting to be pictured in a way that's as original as it's fascinating—*your* world after dark. No longer now need you put away your camera when the sun goes down, for Selo H.P. Roll Film and Ilford Hypersensitive Panchromatic Plates make it as simple for you to take snaps by night as by day. What a chance to obtain results that are really out of the ordinary—either in the brilliant highways, with their flashing signs, or in the dimmer byways where lovely pictures often linger—unexpected and exciting. In your own house too, with a simple arrangement of light, you will secure unrehearsed home snapshots and charming portraits. Take out your camera to-night.

~ The Journal for Everybody with a Camera ~

Vol. LXXXIV.

Wednesday, October 13th, 1937.

No. 2553.

Here's one of the many fine examples of what can be done with a Rolleiflex. It was taken at the falls of Shin, Sutherlandshire, with a 1/500th sec. exposure at F/3.5. It is not only the speed and lens aperture of Rolleiflex which made this subject possible—the brilliant picture seen full size and right way up on the ground-glass screen played a big part—the salmon, when it made its leap, was seen in good proportions on the screen picture. Whereas, to see it in the tiny view-finder of any ordinary camera would have been practically impossible. The new automatic Rolleiflex has advantages well worth bearing in mind when choosing your next camera. It has F/2.8 finder lens, F/3.5 Zeiss Tessar taking lens, Compur Rapid Shutter speeded to 1/500th sec. and bulb, and automatic film-wind eliminating the use of red window. It has many additional and all the other well-known versatile features..... £31.5.0

Ask your dealer to demonstrate, or write for Rolleiflex/Rolleicord brochure and name of nearest stockist from the Sole Importers

A camera that's quite at home indoors

Just about this time of year, when we begin to look less to the sun and more to the "Photoflood" as a reliable source of illumination for pictures, extra lens power is appreciated. And extra lens power is what the Six-20 Duo 'Kodak' provides in handy form at reasonable cost.

In this camera you have: $f4.5$ or $f3.5$ Anastigmat Lens according to model; "Compur" Shutter on three models, 1 to $1/300$ th sec. (the slower automatically-timed speeds extremely useful for night-time photography); Shutter release built-in on camera body itself, finger-tip operated from eye-level position

with camera gripped firmly in both hands. (This makes for smooth, instant co-ordination between eye and hand.)

Careful attention to minor details is seen in such features as the swift single-touch closing mechanism, the secure non-slipping back lock, the easy-grip milled edged winding key, the handy revolving depth-of-focus scale. And satin finish chromium adds its distinctive touch to as nice a piece of precision mechanism as you could wish for, a camera with the speed to make it at home indoors and, incidentally, the compactness to make it an ideal outdoor companion, too. See the Six-20 Duo 'Kodak' at your Kodak Dealer's.

SIX-20 DUO 'KODAK'

Takes 16 pictures $2\frac{1}{4}$ " x $1\frac{1}{8}$ " on 620 Film.

Kodak Anastigmat $f4.5$ Lens and 4-speed Kodak Shutter £7.10.0

Kodak Anastigmat $f4.5$ Lens and "Compur" Shutter £8.17.6

Kodak Anastigmat $f3.5$ Lens and "Compur" Shutter £10.10.0

Zeiss Tessar $f3.5$ Lens and "Compur" Shutter £13.10.0

Use Kodak S.S. Pan Film for all night-time photography. It is lightning fast, anti-halation backed, fully panchromatic. 16 exposures for $1/6$ for the Six-20 Duo 'Kodak.'

SIX-20 DUO 'KODAK'

DON'T BE ALARMEDHE'S ONLY TAKING A SNAP LOOKING
DOWN A CHURCH SPIRE FOR OUR**"NOVELTY"****PHOTOGRAPHS COMPETITION**

£25
FIRST PRIZE.

21/-
WEEKLY PRIZE

You're no need to be a pilot to get good pictures for this novel competition, but if you are an "observer" you'll see any amount of "novelty" pictures. Have you seen the shadows of radars across a pig's back, giving it the zebra's stripes? Or have you looked down the throat of the Zoo rhinoceros? These are only two suggestions for snaps. You can photograph the most common objects from cute angles which will almost lose their identity. We leave you to go ahead. Any amateur may enter using any camera or materials. Remember, the idea behind your picture, together with the excellence of photography, play an equal part in the final judging.

All entries to be judged by Wallace Heaton Ltd., whose decision shall be final. AMATEURS ONLY (Full name, address, title of entry and coupon on back of each entry). ANY MAKE OF CAMERA OR MATERIALS. DEVELOPED, PRINTED OR ENLARGED ANYWHERE. ANY SIZE, MOUNTED OR UNMOUNTED (not less than 8x6 unmounted is recommended).

WALLACE HEATON LTD. HAVE THE RIGHT TO PURCHASE THE NEGATIVE AND COPY-RIGHT OF ANY PHOTOGRAPH SUBMITTED FOR TWO GUINEAS, OR THE RIGHT OF ONE REPRODUCTION FOR 10/6. (If a guinea prize-winner for an extra guinea.) Copyright of the £25 prize-winning photograph and negative becomes the property of Wallace Heaton Ltd., without further payment.

Prizes are 21/- each week and 6 Certificates of Merit. £25 (Twenty-five pounds) for the best photograph submitted during the competition (13 weeks).

If stamped addressed envelope is enclosed every endeavour will be made to return photographs to competitors. No guarantee of safe return can be made, and no entries will be returned unless above is completed with. Acceptance of these rules, etc., is a condition of entry.

A selection of the best entries will be held back at the close of the competition for exhibiting in our galleries prior to their return.

EXCELLENCE OF 'CITY SALE' SERVICE

Liverpool.

"I have tested the Leica II received on the 19th inst., and am perfectly satisfied with its performance. It is a marvellous camera and I would like to thank you for supplying it. Should I require any further apparatus, I will be pleased to place my order with you." A. J. M.

Weston-super-Mare.

"It has been a pleasure to do business with you, as our experience in the past over other transactions (not with yourselves) has been nothing but slackness and inattention, and it is refreshing to meet a more business-like outlook over exchange transactions." R. B.

Bedford.

"I feel I must write and thank you for the way you have treated me with regard to the sale of the camera. I am deeply grateful to you for the concern you showed to ensure I had what I wanted, also for the generous terms you allowed me." A. B.

"KODASCOPE" MODEL EE
With handsome dual-purpose case, which is not only handy for carrying purposes but also acts as substantial vibration-proof base when the Kodascope is in action. "Congratulations,"

Dear Sir,
I am just writing a few lines
delivery of the Projector.
I have tried it out with 30.6
find it does all that is claimed for
smooth and easy to work and the illu-
than I imagined it would be. I should
on the production of all British
figure.
I should be much obliged if you
if possible the following few things:
2 spare lamps for projector
1 40" X 35" Coronet Screen
A further supply of leaflet
Thanking you,
I am,
Yours truly
[Signature]

Dear Mr. Pettifer,
I have this morning
received a Coronet Model 11. projector.
It is certainly a
splendid job for the money, and I have run
a brand new film through it several times
and am glad to report that several times
single scratch on it, not there the first
scratch which one it, not there the first
on the extreme edge of the film.

PANCHROMOSA ROLL FILMS FOR INDOOR PHOTOGRAPHY

Panchromosa is a high-speed panchromatic film giving true colour rendering in monochrome. It is ideal for indoor photography because of its very high speed under artificial light. Speed to daylight 1,700 H. & D. (24° Sch.) to artificial light 3,500 H. & D. (27° Sch.)

Panchromosa Special is a similar film but slightly slower and possesses extreme fineness of grain. It gives negatives capable of considerable enlargement.

GEVAERT LTD., WALMER RD., LONDON, W.10

A FREE book - for every photographer, amateur and professional!

A copy of this fine publication plus a voucher worth 6d. to 3/- if you post the coupon below

This new up-to-the-minute illustrated edition of the "Granville Guide" should be in the hands of every photographer—amateur and professional alike. It contains full working instructions, formulæ, useful articles written by experts, and gives a complete list of materials, including many new lines. The Granville products described in this book ensure perfect results with the minimum effort, whether used by the beginner or the skilled worker. Post coupon to-day to Publishing Department for your free copy of the "Granville Guide." You will also receive a free voucher worth 6d. to 3/-.

LONDON SHOWROOMS: 13, GRAY'S INN ROAD.

12 monthly payments of 9/4, 24 of 4/8.

$3\frac{1}{2} \times 2\frac{1}{2}$, f/4.5 Agfa Solinar anastigmat, delayed-action Compur shutter, speeds 1 to 1/250th sec., T. £7:7:0
12 monthly payments of 12/10, 24 of 6/5.

As above, but with Compur Rapid shutter, speeds 1 to 1/400th sec., T. and B. £7:19:6
12 monthly payments of 13/11, 24 of 7/-.

"RECORD" MODEL
F/4.5 Apotar anastigmat, delayed-action Prontor II shutter, 1 to 1/150th sec., T. and B. £5:5:0
12 monthly payments of 9/4, 24 of 4/8.

Great Success of the ALTIFLEX $2\frac{1}{2} \times 2\frac{1}{2}$ TWIN-LENS REFLEX

THIS CAMERA IS TRULY
AMAZING VALUE!!

This quite remarkable little camera beats all records for sheer photographic efficiency, at a hitherto unheard-of price. A typical WESTMINSTER opportunity. Takes 12 pictures $2\frac{1}{2}$ in. square on normal 120 film. The full-size finder with magnifier allows of needle-sharp accuracy in focusing, and that with the greatest ease, as close as 3 ft.; delightfully smooth and certain lever action. Unique and positive exposure counter. All-metal body with fine leather covering. With Super f/4.5 Victor anastigmat and special Automat shutter, giving 4 speeds and Time exposures. A most attractive and dependable camera for expert and beginner alike. Write for full description, or call and see it at the Westminster as quickly as you can.

Price £5:12:6

12 monthly payments of 9/10.

Obtainable only from
the WESTMINSTER

ROBOT The Camera that does everything for you!

An entirely new and original camera of novel design and ultra-modern features. More completely automatic than any camera yet devised. Takes 48 square pictures on usual 35-mm. cine film, with daylight loading and removal of whole or part of film, film winding and shutter release simultaneously, and permitting automatically up to 24 exposures in rapid succession, with one movement only, if desired. Special "zonal" focusing system taking place of rangefinder. Shutter closely graduated 1 to 1/500th sec. £29:10:0
With f/2.8 Tessar 12 monthly payments of 51/8, 24 of 25/10.

Interchangeable Schneider Tele-Xenar f/5.5..... £10:0:0
With f/3.5 lenses from £23 10 0

FOTH-DERBY Favourite Inexpensive Miniature.

Takes 16 pictures 3×4 cm. on standard V.P. spool.

F/3.5 or f/2.5 Foth anastigmat, self-correcting focal-plane shutter, 1/25th to 1/500th/sec. and B., delayed action, optical tubular finder. Very compact and most efficient. £5:8:6
F/3.5 lens 12 monthly payments of 9/8,
Also with f/2.5 lens at 27 8 6

THESE FEATURES MAKE FOR SUCCESS

- Shoots sequence pictures with machine-gun speed.
- Lens always in "ready" position -- no withdrawing necessary.
- Film winds itself automatically.
- Shutter sets itself automatically.
- Film counter operates automatically.
- No double or overlapping exposures possible.
- Automatic "Zone" focusing gives needle-sharp definition and supersedes rangefinders.
- Takes up to 50 exposures on Standard 35-mm. film.
- Dual cassette loading permits removal of any part of film at any time for development.
- Camera opens in daylight for changing from "pan" to colour film at any moment.
- With motor wound takes from one up to 24 exposures in quick succession, or singly.
- Motor can be left permanently wound.
- Incorporates filter suitable for "pan" or "ortho" films.
- Exposure automatically compensated when using filter.
- Shutter gives "Time" and from 1 sec. to 1/500th sec. -- and all intermediate speeds.
- Weighs 14 oz. -- just heavy enough to be held comfortably without risk of movement.
- Overall size only 4½ x 2½ x 2 in.
- Three view-finders in one, including "right-angle" for "candid" work.
- Daylight-loading spools available.
- Camera has stainless steel body, covered black morocco.

"HALIE" SCREENS

THE provision of simple means whereby a photographic image may be modified for the purpose of artistic effect considerably widens the scope of pictorial photography. It is, after all, the personal touch given by a photographer to his work which causes its value and character; the Halie screens will be found to be most useful in the search for special artistic effects. The critical worker will find that their use enables him to give a particular character to his prints, while the most ordinary of photographs can often be materially improved by using a judiciously chosen printing screen.

By simply placing one of the Halie screens over the printing paper during the printing or enlarging process the image is given a character which makes it different and more pleasing to the eye than a "straight" print.

HALIE SOFT GRAIN SCREENS

Three screens are available:

- A. Fine grain, for slight softening.
- B. Medium grain.
- C. Coarse grain, for strong effects.

HALIE OIL PAINTING SCREENS

Produce an image of characteristic and unique appearance. Supplied in pairs, one of each, Soft and Coarse.

SOFT GRAIN SCREENS.		OIL PAINTING AND LINEN.

SANDS HUNTER & CO. LTD.
37, BEDFORD STREET, STRAND, W.C.2

Look for this sign in
your dealer's window.

Indoor work . . .

picture-making in the home offers many opportunities for the keen amateur during the winter months, and the Ikoflex is just the camera to record these delightful subjects.

With its special focussing screen . . . which really consists of a plano-convex condenser lens ground on the under side . . . an exceptionally brilliant image is seen on the focussing screen even in artificial or dull light . . . and the rapid Zeiss Tessar or Triotar f/3.5 permits indoor work to be undertaken even at night without the aid of auxiliary illumination. . . . The Compur Rapid shutter to 1/500th or Compur normal shutter to 1/300th second will arrest the movement of most winter sports . . . and an eye-level view-finder is formed by the front and back of the finder hood for sports subjects.

The Ikoflex takes the usual $3\frac{1}{4} \times 2\frac{1}{4}$ in. roll film and gives 12 pictures $2\frac{1}{4} \times 2\frac{1}{4}$ in.

VOL. LXXXIV. No. 2553.

THE little bundle of family snaps brought out to show an acquaintance does not really deserve the derision with which some people regard it. It is one way of effecting introductions. The topics of conversation between people who are thrown together but do not know one another very well are severely limited. There is the weather, of course, but that is soon exhausted. Current events open up a field for possible dispute on political subjects and are only to be entered upon with great care, lest acquaintanceship be nipped in the bud. But the little envelope of snaps taken on a recent holiday opens the gate to friendliness. Comparative strangers are not uninterested in seeing what their respective families look like and how they enjoy themselves in the back garden or at the seaside. Especially the women. Family matters as recorded in the photograph are by no means so boring to other people as the satirists would have us believe.

The Paris Exhibition.

An article in the French paper "Candide" is entitled "The Decadence of Photography." Its theme is the photographs shown at the Paris Exhibition of 1937. In one sense, it says, that exhibition represents the triumph of photography, for photography is everywhere—landscapes, machinery, human beings, all are photographed. Photography is the method of choice in every pavilion for showing the treasures of a country. Yet this writer finds in the very triumph some germs of decadence. His complaint seems chiefly to be on the score of the mammoth enlargements. These immense photographs covering the walls of the pavilions come upon

"A FAIR COP."

See article, "Tinker, Tailor, . . ." elsewhere in this issue.

one with something of a shock. Frankly, one begins to be tired of finding a small piece of motor car mechanism enlarged up to the dimensions of a railway carriage, or a banana the size of a tree trunk. It is admitted that in a great exhibition there is no time or patience available for the study of small detail. Things have to be big to catch the eye. Everything has to be swollen and magnified out of all proportion. Everything must be on a placard scale. But the charm of photography is not in mammoth enlargement, but in the reproduction of detail with some sense of appropriate size and perspective. The writer says that the most interesting pavilions to visit are those of the small countries—Denmark, Finland, Portugal—which have not had the temptation of the large countries to illustrate a vast miscellaneous production, but have concentrated upon a few products. The illustration of these, largely by photography, but also by actual samples, is admirably done.

Thinking Machines.

The casualness with which some amateur photographers go to work is a continual source of amazement. We noticed the other day on a lake steamer a girl taking a photograph of a passing craft, resting her camera on a bit of the framework of the boat which, owing to the pulsation of the engines, was trembling like the familiar aspen leaf. She poised it on this insecure hold and took her picture with all the coolness in the world. Other people seem to use their little cameras without knowing or caring whether they have wound the spool. It strikes us that there is a good deal more faith than works in photo-

graphy. The works, of course, are supplied by the instrument makers and film producers, and the casualness with which many camera users go out with their instruments is a silent and unconscious tribute to the finest workmanship and ingenuity of those who turn out the appliances and material. The machines, as one advertisement says, "do your thinking for you." Photographic manufacture, like so many other lines of industry, is chiefly concerned in making a world safe for button-pressers. It is not altogether a gratifying or satisfying thought, for photography, if people would only believe it, is at least as interesting in its processes as in its results, in its means as in its ends.

Freak Lighting.

The German celebrations at Nuremberg have produced some wonderful photographs. One striking example shows what appears to be an aerial curtain, symmetrical perpendicular folds extending from the sky to the earth. It was produced by vertical projections

from the great Zeppelin, but the airship itself is above the upper margin of the picture, and it looks as if the space between sky and earth had formed itself into an unsubstantial but regular colonnade. That is only one of many aerial effects suggesting the conquest of the air as well as the earth and the water, but it has the merit of being singularly picturesque. It also provides ideas for our pattern enthusiasts. Nature, when it sets about it, of course, can produce effects which outdo the most ingenious that men can arrange. One has only to contrast an illuminated fountain in a Swiss waterway with a rainbow in the mountains. Recently with a photographic colleague we waited on the deck of a cross-channel boat for the green ray which spreads itself out the instant the setting sun reaches the horizon at sea. It did not materialise—if that is the word—on that occasion owing to mist, but it is a phenomenon worth waiting for if one happens to be at sea with a clear view of the setting sun, without intervening land.

Mickey Mouse, M.A., B.Sc.

After seeing an Imperial Chemical Industries film showing the first to last of the ammonia process we feel glad that Mickey Mouse has at last found his true vocation. He has donned the cap and gown of a teacher of science. Up to now the animated cartoon, most wonderfully clever as it is, has had only the same function as the comic strip in the newspaper. But Imperial Chemical Industries, in this film at least and maybe in others, has employed the method to bring home facts about chemistry and industrial processes. There is always a touch of the comic in seeing inanimate objects apparently moving of their own volition, and while one laughs at the jerky movements shown in the film, one learns quite a lot about abstruse chemical processes and what goes on in retorts and ovens. There is here an idea for making lessons in chemistry and physics, and possibly other solemn subjects too, not only informing but uproarious. School will soon be just as much fun as going to the cinema.

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with under this heading week by week. Other replies appear as usual on the last page.

An All-round Developer.

Is there such a thing as a developer that will work equally well for negatives, development papers and transparencies? If so, can it be suitably modified to suit the material used, and the effect required?

H. P. (London.)

There are several types of developers that will more or less satisfy the first of your requirements, but the second desideratum is another matter. Even the concentrated single-solution developers will answer more or less satisfactorily for making negatives, lantern slides, and prints on bromide or gaslight paper. But the scope for variation is naturally limited, as nothing can be done beyond varying the degree of dilution and the quantity of restrainer added.

Full detail and low contrast, if required, can be readily obtained with such a reagent as metol; great density and contrast are more easily secured with hydroquinone. A solution that will work well with bromide paper may be far less satisfactory for gaslight paper, and not at all suitable for chloro-bromide. And so on.

About a couple of years ago we published an article by Mr. E. Barwell in which he suggested formulæ for four stock solutions from which various working solutions could be quickly prepared. Although we cannot repeat all the information then given, we will give a general idea of the method, which offers probably the best available solution of your problem.

The four stock solutions are:

A. Hydroquinone	120 grs.
Sodium sulphite	2 oz.
Water to	20 oz.
B. Metol	160 grs.
Sodium sulphite	2 oz.
Water to	20 oz.

(Dissolve the metol and the sulphite separately in warm water, and then mix the two solutions.)

C. Sodium carbonate	3 oz.
Water to	20 oz.
D. Potassium bromide	1 oz.
Water to	10 oz.

Here are a few sample working solutions:

Soft negatives. B, 1 oz.; C, 1 oz.; D, 8 drops.

Normal negatives. A, 1 oz.; B, 1 dr.; C, 1 oz.; D, 15 drops; water to 4 oz.

Hard negatives. A, 1 oz.; C, 1 oz.

Normal bromide. A, 1 oz.; B, 1 dr.; C, 1 oz.; D, 20 drops; water to 4 oz.

Gaslight paper. A, 1 oz.; B, 1 dr.; C, 1 oz.; D, 10 drops.

Chloro-bromide. A, 1 oz.; B, 5 drops; C, 1 oz.; D, 30 drops; water to 4 oz.

These should give an idea of the lines on which to experiment.

Copper Toning.

What colour is obtained by toning bromide prints with copper? Will you give me a formula, so that I can try it?

A. C. P. (Wood Green.)

Various colours are obtained by this method, as the tone becomes warmer and warmer as the action continues. The colour becomes colder on drying, so that experience is needed. Here is the standard formula:

Neutral potassium citrate	350 grs.
Copper sulphate (10 per cent solution)	5½ drs.
Pot. ferricyanide (10 per cent solution)	4½ drs.
Water to	20 oz.

When the desired tone is reached the print is well rinsed, fixed in a plain 5 per cent solution of hypo, and thoroughly washed.

At This Time of Year

The failing light and the lower temperatures that autumn conditions bring, call for modifications in the photographer's procedure both out of doors and in the dark-room. This article draws attention to these points, and makes some useful and seasonable suggestions.

AT this time of year the photographer needs to be on his guard against the effect of weaker lighting. Although the intensity of the light falls off rather rapidly during October, this need not be a source of failure as long as the change is watched and allowed for. After all, the modern photographer is able to continue his activities not only into the late autumn, but all the year round.

Autumn Opportunities.

This is because faster lenses and more sensitive material have made the photographer almost independent of lighting conditions. It is not so very long ago that the weaker lighting of autumn gave the signal for the close of the photographer's season, and all but the most enthusiastic photographers put their cameras away until the brighter days of spring. There is no longer any need for this, and it is not only true that picture-making can be carried on all the year round, but many photographers find greater opportunities during the winter than during the summer. In addition to the great variety of indoor subjects, autumn and winter bring effects of atmosphere and cloud that are not found during the brighter months that attract the photographer.

Lighting and Exposure.

The photographer who uses an exposure meter will soon find that exposures have to be longer. Except under poor lighting conditions it still may not be necessary to use faster material, especially if the camera is fitted with a lens of large aperture. For many subjects it may mean that the full aperture of the lens must be used, and possibly a slower shutter speed than has been customary during the last few months. It must be borne in mind that the slower speed "fine-grained" films are far more speedy than were the fastest of plates of twenty-five years ago, and fast lenses, instead of being a rarity, are now fitted to all but the very cheapest cameras.

The wise worker will religiously use an exposure meter at this time of the year, for while it is possible to do without one and still get good results during the more constant light of summer, autumnal lighting conditions

are deceptive, and it is very easy indeed to be misled into giving wrong exposures. Giving too short a time is the usual mistake, through failure to realise how much less intense the light has become, even in a few short weeks, but it may also happen that exposures turn out to be shorter than the photographer expects because the softer lighting which prevails reduces the blackness of the shadows.

The Effects of Cold.

Lower temperatures, as well as fading light, are characteristic of autumn. The photographer should watch for the possible effect of condensation of moisture upon the lens, especially when the camera is brought from a colder atmosphere into a warmer one. We have known of cases in which the warmth of the hand has caused condensation when fitting a colour filter to the lens on a cold morning.

Care must be exercised to see that the glass of the lens, and the surface of the colour filter too, is free not only from moisture, but also from the dull film that tends to appear upon the glass during the winter season, especially in cities or large towns. The latter will not only decrease the brilliance of the image, but may also affect the definition.

If the camera is used out of doors it is a good plan to provide the lens with a cap. This will prevent the need for frequent cleaning, which has a bad effect upon the soft glass from which nearly all lenses have to be made.

Solutions.

The effect of the colder weather makes itself felt in the dark-room too. The photographer who uses a tank for development of films will notice the fall in temperature, and will increase the time of development accordingly. Fixing solutions take longer to act, and this has also to be allowed for.

Cold-weather printing has its pitfalls, too; not only are solutions slower in action, but they may even give prints of indifferent quality. It is well known that hydroquinone becomes comparatively inactive at temperatures lower than 40 degrees Fahr., and in the case of an M.Q. developer, this means that the metol

has to do all the developing, which may very easily lead to the production of soft grey prints when strong ones are expected.

Try Chlorquinol.

This difficulty can be to some extent avoided by replacing the hydroquinone by one and a quarter times its weight of chlorquinol, a developer which is considerably less sensitive than hydroquinone to the effects of temperature.

While on the subject of temperature it may be well to point out that many workers bring the latter up to the point required by the addition of a little hot water to the developer. If the solution is used at once, and for only one or two prints, this may serve to meet the needs of the case, but if it is not used immediately the temperature will not be maintained, especially in an open dish. A good plan is to keep the solution at the right point by means of an electric immersion heater.

Temperature and Exposure.

A point that is worth mentioning is that the exposure required for a bromide print or enlargement may depend to a very considerable extent, at least with some makes and types of paper, upon the temperature of the developer into which it is put. If, therefore, the first test-strip is developed in cold developer, and it is decided to warm up the developer before settling down to serious printing, it may be found that an enlargement exposed according to the results of the test-strip proves, when treated with the now warmed developer, to have had much too much exposure. The temperature of the developer should therefore be kept steady.

Dark-room Comfort.

A small oil-stove or other heater placed in the dark-room for an hour or two will warm the various solutions quite effectively, and has the additional advantage that as the whole room is warmed the temperature of the developer cannot change except very slowly. Also the worker is made comfortable. Comfort in the dark-room is important, for not only will the photographer be more inclined to start work if the conditions are comfortable, but he will be more likely to do his best work.

The Artist.

FOR the amateur photographer who deplores the lack of pictorial material for his camera, particularly at the present time of year, I commend to him the study of different types of working men and women, engaged in their avocations. All that is necessary is the seeking out of suitable models and obtaining permission

The Baker.

to photograph the poses wanted.

On this and the opposite page are photographs illustrating various types. Each is definitely different from any other, and each has the making of a good picture. They are all straightforward photographs, and they were all taken indoors, some by daylight and some with the assistance of artificial light or a flash. They are merely put forward as suggestions as a line of work to be recommended to every amateur.

It is difficult and often impossible for anyone except a professional model

"TINKER,"

By GWYNETH PENNETHORNE.

The Basket Weaver.

The Electric Welder.

to look natural to order, but take someone at his daily work, and camera-consciousness ceases to be a bugbear. The work, of course, may be any occupation with which the subject is familiar, and which tends to take his thoughts from the fact that he is being photographed.

My own method is to ask the sitter to carry on with his job and pay no heed to me. I then walk round and find the best position for the camera with regard to the lighting, etc. In this way one is able to watch the model and note any characteristic attitudes. When all is ready it

TAILOR, . . . "

The Photography of Types.

A never-ending, all-the-year-round subject for the keen amateur in search of pictorial material.

The Potter.

is only necessary to say, "Please keep like that for a moment," and press the trigger. Many people who would refuse to pose formally have no objection to being taken

at work, and by this method it is not only possible to get natural pictures, but there is ample time to decide on focusing, stop, exposure, etc., without feeling that one is wearying the model.

A miniature camera is especially useful on these occasions, as so often one has to work in cramped surroundings. Only with a tiny camera and dwarf tripod was it possible to get the potter in the confined space available in a very small workshop. Then, too, the depth of focus of the miniature allows of a large stop and short exposure, so that in some cases a snapshot can be taken while the subject actually continues his work. Besides these advantages there is the fact that the miniature can always be with one, so that should one chance on an unusual trade a picture can be secured at once. As a rule ordinary workshop lighting is good enough, but at times a flash-bulb is useful as a supplementary light.

The Durrymun.

Readers' Hints, Tips and Gadgets

A GASLIGHT SAFELIGHT.

GASLIGHT printing is the ideal process for home use because it can be carried on in the comfort of an ordinary living-room. Its one disadvantage is that loading the printing-frame and developing the exposed prints must both be done at some distance from the white light. This means either occupying a separate table for the latter operations, walking to and fro between them for the purpose of making exposures, or else rigging up some sort of screen in the shade of which they can safely be done.

By having a spare lampshade frame, covered on one side only with a sheet of translucent yellow material, it becomes possible to do the whole of the work on the one table, and without interfering with the comfort of other people in the room. Almost any sort of material can be used, from the regular "yellow fabric" of the photographic trade to a sheet of tissue paper. For gaslight paper almost any depth of yellow light is safe. Therefore on the shaded side of the lamp one has a safe illumination of practically equal brilliance to the open side where exposures can be made. Working near the bright yellow light one can now judge the depth of prints in the developer to a nicety.

When printing on rapid brands of gaslight or bromide paper one is often tempted to employ a small electric bulb as the source of light. The trouble with any clear bulbs is the unevenness of the illumination they give, especially at comparatively close quarters. A much better plan is to use an ordinary large "pearl" or an opal bulb at a greater distance. Increasing the distance of the lamp from the printing frame is equivalent to decreasing its effective power, but a more even illumination is secured.

DAVID CHARLES.

A PISTOL GRIP.
